PDQ II MAKES YOUR APPLE MICRO PERFORM LIKE A MINICOMPUTER

PRODUCTIVITY INCREASE

PDQ II will make your Apple II or IIe outperform itself. It will fly through tasks which used to take hours. It will perform multiple tasks at the same time. Most Apple software programs will exhibit a 200 to 2,000 percent increase in speed, without reprogramming.

NEXT GENERATION CAPABILITIES

That's not all—when you plug a PDQ II into your Apple, it will provide the advanced features of the 16/32 bit MC68000 microprocessor. Your Apple will be capable of utilizing sophisticated, "next generation" software products.

ONE SIMPLE SOLUTION

PDQ II eliminates the need for numerous add-ons — it includes an integrated high speed pseudo-disk, printer/communicatons buffer, memory extension capability and a powerful 16/32 bit processor. PDQ II consists of two system boards which simply plug inside your Apple, making your Micro think it's a Mini.

INSURANCE FOR THE FUTURE

PDQ II provides a powerful p-System run time environment, making it possible for your Apple to take advantage of many of the hundreds of high-quality p-System applications...the same applications available for Digital, IBM, HP, and other computers.

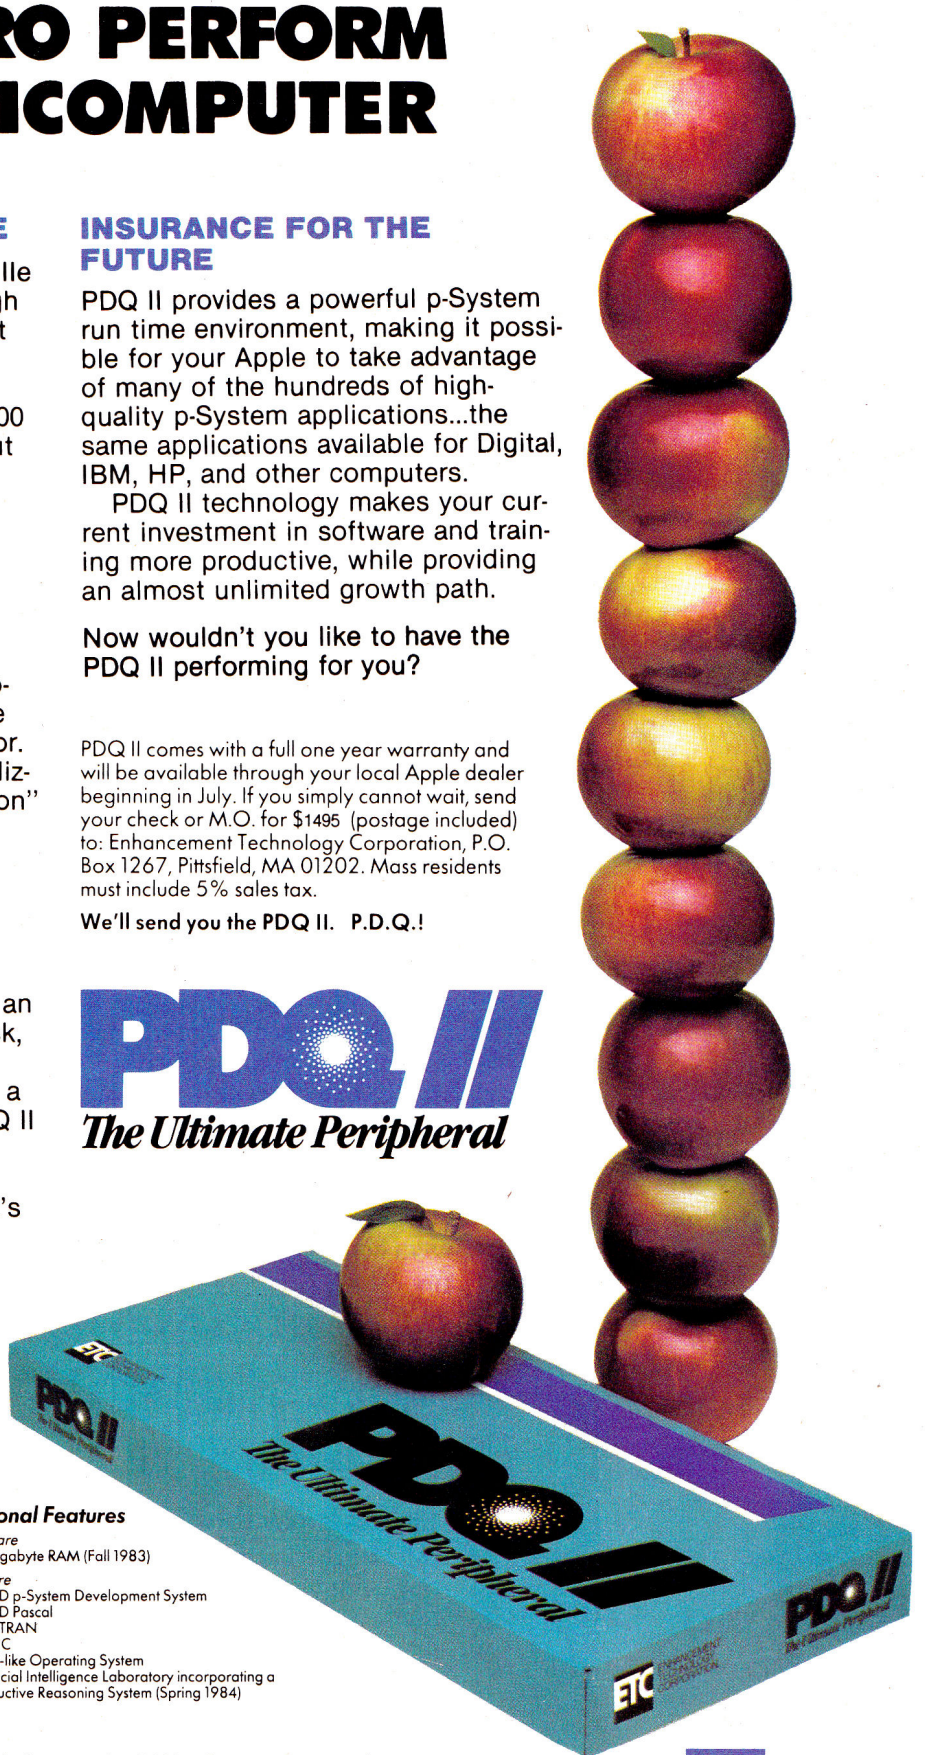

PDQ II technology makes your current investment in software and training more productive, while providing an almost unlimited growth path.

Now wouldn't you like to have the PDQ II performing for you?

PDQ II comes with a full one year warranty and will be available through your local Apple dealer beginning in July. If you simply cannot wait, send your check or M.O. for $1495 (postage included) to: Enhancement Technology Corporation, P.O. Box 1267, Pittsfield, MA 01202. Mass residents must include 5% sales tax.

We'll send you the PDQ II. P.D.Q.!

PDQ II
The Ultimate Peripheral

PDQ II SYSTEM SPECIFICATIONS

Standard Features

Microprocessor
- 16/32 bit MC68000
- 10 MHZ

User Memory
- 256K Bytes RAM

Integrated Functionality
- Multiple printer/communications buffering
- Pseudo-disk operations
- Track buffering (p-System)

ETC Software
- ETC MC68000 Assembler
- ETC MC68000 System Monitor
- ETC p-System (version IV) to Apple DOS Interface Utility

Languages and Software Systems Supported
- Applesoft BASIC Compatibility & Speed up
- Apple DOS 3.3
- UCSD p-System (version IV) Interpreter—executes UCSD Pascal, FORTRAN-77 and BASIC P-Code

Optional Features

Hardware
- 1 Megabyte RAM (Fall 1983)

Software
- UCSD p-System Development System
- UCSD Pascal
- FORTRAN
- BASIC
- Unix-like Operating System
- Artificial Intelligence Laboratory incorporating a Deductive Reasoning System (Spring 1984)

Apple II and Apple IIe are registered trademarks of Apple Computer, Inc. UCSD p-System is a registered trademark of the Regents of the University of California. P/S™ Buffer Card

The ONLY BUFFER that let's your Apple II™ & IIe™

ALL AT THE SAME TIME

ALL FOR $125

PRINT PARALLEL!
PRINT SERIAL!
PROCESS/COMPUTE/ENTER DATA!

EXPANDABLE TO 64K

No more waiting for your printer or other peripherals to finish with your Apple before you can use it again. Just plug the P/S Buffer Card into any slot and cable-connect to your parallel output card. After transfering your data to buffer (it takes only seconds), you'll be able to continue using your Apple in a normal fashion while printing parallel, or serial. . . or both parallel and serial – all at the same time.

In the dual printing mode, data to be printed parallel and serial are stored separately in the buffer memory. The memory is divided between them by intelligent firmware, proportional to the storage requirements of each. The memory is expandable to 64K maximum in increments of 16K with plug-in RAM modules available from your dealer.

P/S Buffer Card has both a parallel output port and an RS-232C standard serial output port. When you need to change from parallel to serial, serial to parallel, or output both simultaneously, you don't have to physically change cards. The intelligent firmware lets you do it by either software command or (optional) hardware switch.

P/S Buffer Card interfaces with most popular parallel printer cards including Apple,™ Epson,™ Grappler,™ Graphitti,™ PRT-1,™ and Tymac.™ If you don't already have a parallel card, order the P/S Buffer "Stand-Alone" Card. It includes a built-in parallel interface. An optional graphitti plug-in ROM allows you to dump the Apple hi-res graphic screens with a few simple keyboard commands.

Many applications programs and operating systems such as CP/M™ and Apple Pascal™ require that the parallel interface be in a specific slot. So, leave it there. When you wish to print parallel, or serial, or both at the same time, just "tell" P/S Buffer Card what to do. It's that easy.

See your local dealer for details.

SUGGESTED RETAIL PRICES:

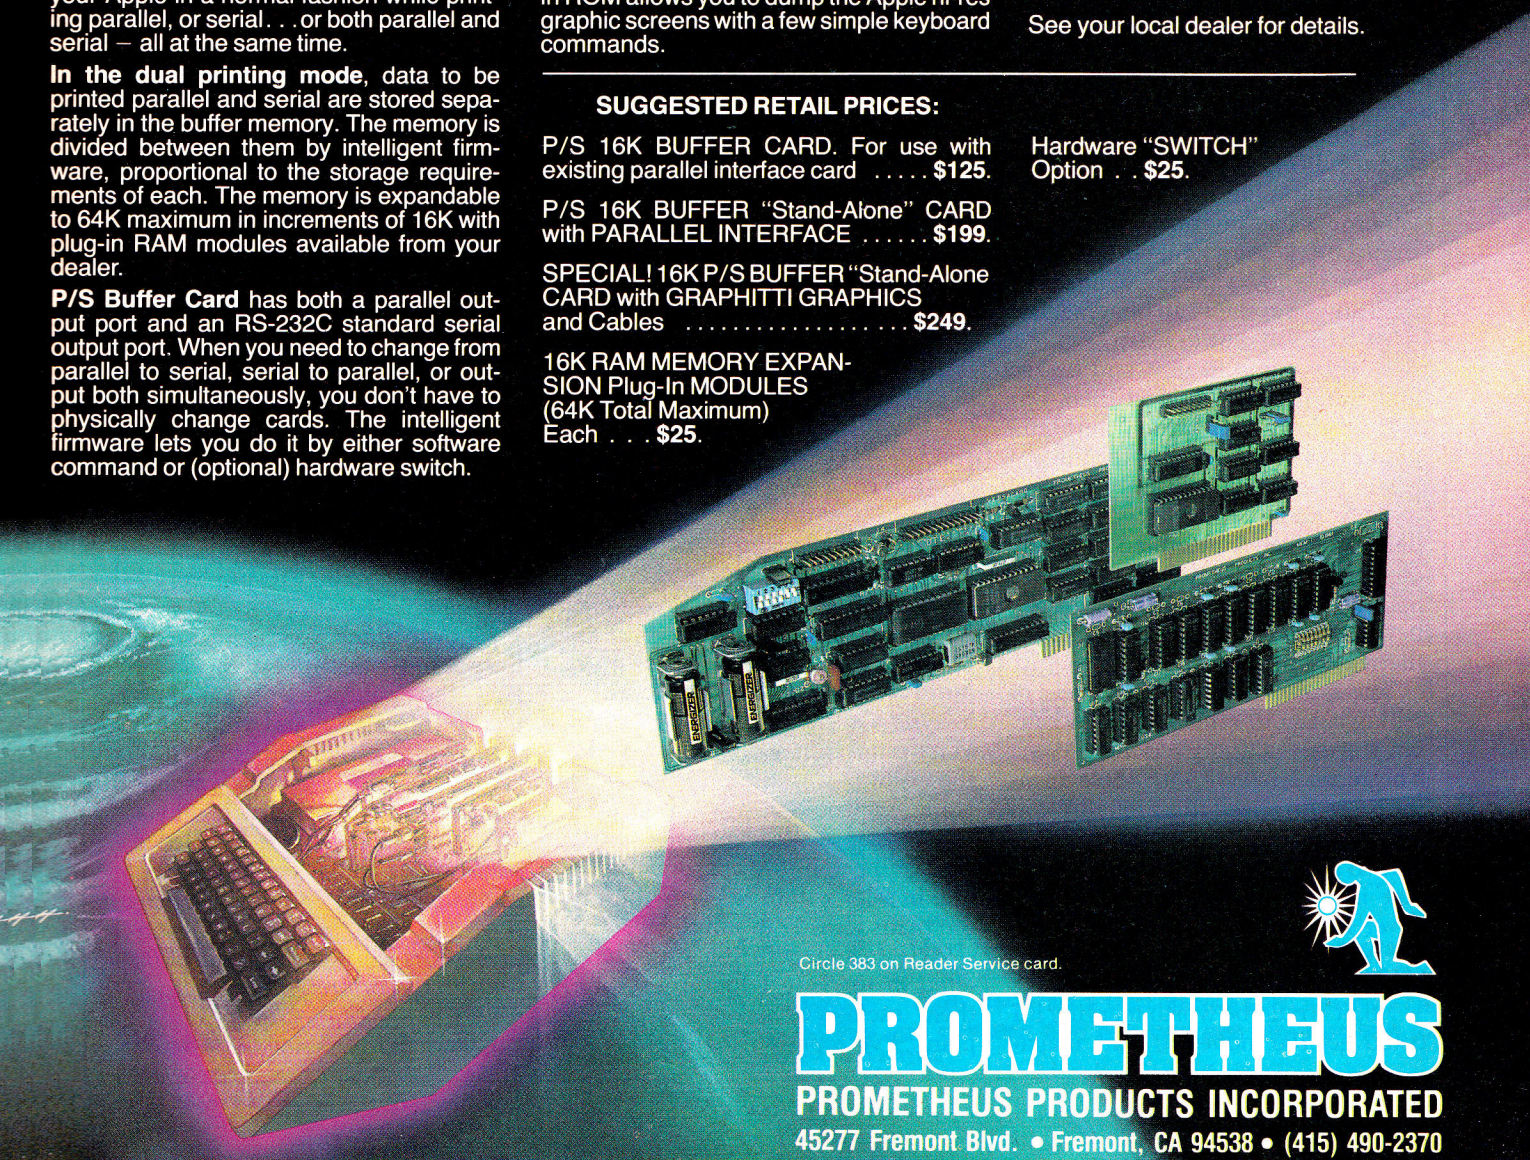

P/S 16K BUFFER CARD. For use with existing parallel interface card . . . . . **$125.**

P/S 16K BUFFER "Stand-Alone" CARD with PARALLEL INTERFACE . . . . . **$199.**

SPECIAL! 16K P/S BUFFER "Stand-Alone CARD with GRAPHITTI GRAPHICS and Cables . . . . . **$249.**

16K RAM MEMORY EXPANSION Plug-In MODULES (64K Total Maximum) Each . . . **$25.**

Hardware "SWITCH" Option . . **$25.**

Green Sells Out

In a way, I suppose, you might say that I sold out, but I plead guilty with an explanation. And by the way, if you're interested in joining a fast rising firm, you could do worse than read on.

It all started this last spring when some chaps from one of the bigger banks called saying they had a large foreign publisher looking to acquire something like my micro publishing empirette. I wasn't much interested because I enjoy what I'm doing more than anything else I can imagine. But what would it cost to listen, right?

So they came to visit and looked over our place. I showed them our growth in sales, which has run around 50 percent a year for the last eight years, limited only by all growth being 100 percent self-financed. They mumbled vaguely about $50 million, which I have to admit got my attention. I'd really never given much thought to what the whole mess might be worth.

The word that I was thinking of selling began to spread and new suitors started calling every few days. The more I talked with these firms the more I realized this probably was a good time to merge with a larger firm so I would have the money to invest in some new projects. I have never had much of a personal need for money, so selling out for a big bundle of cash had little attraction.

No, it would be worth merging if I could get the money to start magazines at a faster rate and thus be able to better keep up with the needs of the microcomputer industry. And I had an idea for a new type of magazine I wanted to try out. If it worked I'd have a way to get perhaps fifty more like it going, each with expected sales on the order of $5 million a year or more.

Then there was my idea for a new type of school—a business/technical institute geared to the needs of the 80s. The more I thought about it, the more ideas for new divisions of Wayne Green Inc. came to mind. With some cash available for getting these new businesses and publications going, we could step up our growth enormously. I did some sales projections and I could see us growing a billion in sales within ten years, just on the plans already in mind.

"I had an idea for a new type of magazine I wanted to try out."

As I talked with the firms interested in merging I found several of them excited about my ideas and plans. I've a good record of coming up with innovative ideas in the past, so there wasn't much skepticism about my new ideas. After all, I'd had the idea to start the first magazine for micros: *Byte*. And then I started the first system specific magazine: *80 Micro*. And I'd pioneered mass-produced software. As I talked with people I realized very few other visionaries have such good track records.

The final choice of a merger partner was most difficult. Several large firms put it bluntly: They needed me and I could name my price. Now I want to tell you, that is fantastic for the ego. I really wasn't into shopping around for the highest offer because the difference between $50 million and $100 million is a lot less than the compatibility of the merger. And numbers like that don't mean anything anyway, they're just very big numbers.

On May 22nd I signed a preliminary agreement with Pat McGovern. He's the publisher of *Computerworld*, *InfoWorld*, and so on, and his operation is several times the size of my firm in sales. The date was significant to me because it was eight years to the day from when I called the editor of a small micro newsletter to come up and discuss starting a magazine, and we agreed to give it a try. Five weeks later the first issue of *Byte* went to the printer. Those were five frantic weeks, I'll tell you.

Getting *Byte* started was ex-

ASHAMED

TO ADMIT THAT YOU MADE A BIG MISTAKE? . . .

. . . That you bought some Apple® or Apple® compatible software, hardware, firmware or accessories from an unknown company, and after all was said and done, you didn't save a penny . . . it took forever to get your merchandise . . . maybe you called back for service on what you had purchased and discovered "the number you have reached is no longer in service and there is no new number!" If any of this scenario fits your situation, we recommend the following solution to avoid further embarassment: 1) hide your red face with the disguise provided (at left) 2) Place all your future orders with a company who will never embarass you . . .

hausting work, but fun. We'd just gotten it off to a good start when the editor and my office manager moved the magazine out in the middle of the night, a stunt I still haven't gotten over.

The merger means that we'll be able to do more promotion of our current magazines. It means we'll be able to start more magazines—and I have a bunch of them all planned out. Each magazine is going to require a staff, so we'll be needing two or three hundred people to help out—editors, writers, technicians, programmers, people for advertising sales, typesetting, graphic arts, circulation, data processing, and so on.

Then there are a number of special projects, such as my planned technical/business college. We're going to need management teams to get these projects going and run them. Most of this is going to be done in New Hampshire, but eventually we'll be growing into other areas of the country.

If you are interested in getting involved with some exciting new ideas, you should get a letter off to me telling me what you think you might be able to do. I'm looking right now for nonsmokers with a history of enthusiasm and the ability to make things happen with a minimum of supervision.

There won't be any astronomical salaries when we are starting new projects, but we will plan to make it well worthwhile for those who are the most helpful in starting the new projects.

For instance, there are a number of products I'd like to have made in Asia and import for sale here. I've got the contacts in Asia to handle that end, but I need the people to handle the project from the New Hampshire end—setting up the advertising, importation and distribution of the products. This should be able to grow into a substantial business by itself.

Why New Hampshire? Well, mostly because this is one of the best places in the country to live. The quality of life is wonderful and the cost of living far less than in New York or Silicon Valley. We still don't have any state sales or personal income taxes in New Hampshire. We're in a small town with all of the advantages of a small town. The people are friendly and the crime rate low.

If you are looking for the chance of a lifetime to get in on some new projects, and if you think you can hack it, let me know. You're going to have to prove you can get things done. We have no free rides here, just a bunch of enthusiastic people all having the time of their lives working hard and turning out first rate products. We're working out of old houses, converted motels and barns, and so on. This is not IBM.

You can be old, young, black, white, red, brown, male, female, undecided, but if you smoke please don't bother me, okay? The air up here is invisible and we want it to stay that way.

"We're working out of old houses, converted motels and barns, and so on. This is not IBM."

The merger means that we have a guarantee of the money we need to move ahead on as many projects as I can find teams to work on. And if we run out of projects to get started, I'll have more. I come up with an idea for a good solid project every few days.

When you think about it, by the time you put my six magazines together with those Pat is already publishing, we're a very strong combination. I think we'll be able to parlay this group into a pilot model of the college of the future, into perhaps an educational satellite television network. . . things like that.

Pat is much like me—full of ideas and enthusiasm. I think we're going to really make things hum in the microcomputer field. Care to join us? ■

With 3M diskettes, your computer never forgets.

3M diskettes remember everything, every time. Because at 3M, reliability is built into every diskette. We've been in the computer media business for over 30 years. And we've never settled in. We're constantly improving and perfecting our product line, from computer tape and data cartridges to floppy disks.

3M diskettes are made at 3M. That way, we have complete control over the entire manufacturing process. And you can have complete confidence in the reliability of every 3M diskette you buy.

Look in the Yellow Pages under Computer Supplies and Parts for the 3M distributor nearest you. In Canada, write 3M Canada, Inc., London, Ontario. If it's worth remembering, it's worth 3M diskettes.

3M hears you...

Submissions: We're always looking for first-class manuscripts at *inCider*. If you have written a useful or entertaining program for the Apple, why not share it? Conversions of programs published in *80 Micro* or *Microcomputing* are also welcome. We'll consider publication of any material for the Apple. Guidelines for budding authors are available—just address an envelope to yourself and include it with your request.

inCider magazine is published monthly by Wayne Green Inc. Entire contents copyright 1983 Wayne Green Inc. No part of this publication may be reprinted, or reproduced by any means, without prior written permission from the publisher. All programs are published for personal use only. All rights reserved.

WARNING

The Line Cleaner project described in the August issue of *inCider* (p. 108) included a wiring diagram in which the ground wire is shown ending at the EMI/RFI filter. This is incorrect and possibly dangerous. The wire must continue through to LOAD. The text and photo make this clear; please be certain to carefully check the position of the green (ground) wire.

Hi. . .

The good news in education is that teachers and parents have discarded old prejudices about computers and have begun to accept them for what they are: potent new educational tools that can enhance the curricula of the nation's schools.

In that spirit we present our own back-to-school feature section illustrating how Apple has helped to put computer power within reach of the nation's students and teachers.

Perhaps you're a grade school teacher trying to develop a specialized CAI curriculum. If so, be sure to read our review of SuperPILOT, Apple Computer's new language which helps create interactive tutorials for the classroom. For teachers and others interested in developing effective courseware, this program should be of great interest.

Laughing Bear is a well-executed spelling program that uses music and graphics to teach youngsters in a non-threatening manner. As a bonus, the listing's utilities easily can be incorporated into more sophisticated software.

Bright as the prospects are for making effective use of computers in the traditional classroom, the Apple holds even greater promise for special needs students. Look for our overview of what's going on in this sector of education, and how computers are helping all students achieve richer, fuller lives.

You won't want to miss "Logo Talks Back," by Donna Bearden and Jim Muller. Much more that a vehicle for turtle graphics, Logo's powerful list and text processing capabilities can open up new vistas of educational applications.

And speaking of new vistas, we hope you enjoy Stephen Wilson's computerized group encounter carried out in mellow California style.

Finally, just for fun, you'll enjoy our special two-page color spread of the Tasman Turtle being put through its paces.

From here we leave education and move on to other momentous topics, like games. Consider "Chase," a quick and easy amusement you'll be able to keystroke in no time flat.

In an *inCider* exclusive, details of Avant-Garde Creations' hot new SuperSprite Graphics system are disclosed publicly for the first time. A combination hardware/software package, this phenomenal new product gives Apple users the power and versatility of sprites which heretofore were available only on a few other microcomputers.

And if you like quick and dirty construction projects, you'll just love George Engel's article. This *has* to be the least expensive peripheral ever devised by man. But we'll let George speak for himself.

And Dan Bishop's column, The Applesoft Adviser, ties in nicely with our educational feature slant. Dan combines his computer expertise with his ten-year experience as a college professor to offer sage advice on designing some educational programs.

Regular readers of Hints 'n' Techniques will not be disappointed. First we serve up a soft switch for MBasic that allows the user to add Applesoft flexibility to CP/M. Next in the lineup is a program loader that cuts out much of the drudgery usually encountered during programming. Batting third is a fine little software protection program. And finally, we present a program for proper printouts that squelches some annoying idiosyncrasies common to print statements.

Now if all that doesn't hold you, we suggest you turn to our review section and immerse yourself in some hard-nosed critiques of hardware, software and other Apple-related products. And don't forget New Products. . . as usual, we've done our best to sift through the enormous crop of new offerings for the Apple.

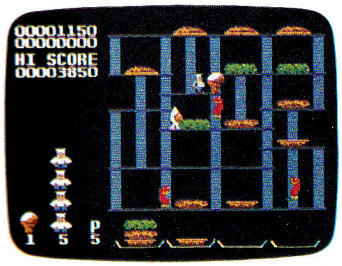

Be sure to join us next month when we turn our attention to "Apples in Business." ■

Educators Give Video Games High Marks

David N. Perkins, a Harvard University researcher in cognitive psychology and education, presented a hopeful vision—a vision that video games will revolutionize learning—at a three-day conference on video games and human behavior at Harvard's Graduate School of Education.

Perkins' vision, an educational heaven, takes place in the typical American home, perhaps in a decade. The family owns several microcomputers and a library of educational software written in different game formats. Children learn algebra, spelling, history, English composition and other subjects with enthusiasm—and without coercion! Schools are dying out like the dinosaurs.

Can such an educational heaven exist in a decade or two? It is unlikely. But there is a more important question that should be pondered right now. How can educators and the high tech industry make the best use of video games techniques for education?

Clearly, the violent shoot 'em up video games have no educational worth and may be, as a recent *Newsweek* article suggested, "extracting something more than quarters from America's youth." But on the other end of the spectrum, games like Rocky's Boots are leading the educational computer industry into exciting new territory. It is no easy task to teach *anyone*, never mind young children, to learn how to construct computer logic circuits. "Rocky's Boots," according to Judah Schwartz, Professor of Engineering Science and Education at MIT, "has helped people break prior notions of what can be taught."

The Harvard symposium was sponsored with a $40,000 grant from Atari Inc., and names of potential invitees were supplied by the Atari Institute for Educational Action Research. Skeptical opinions of the educational value of video games were scarce, and the lack of balance surely damaged the credibility of the conference.

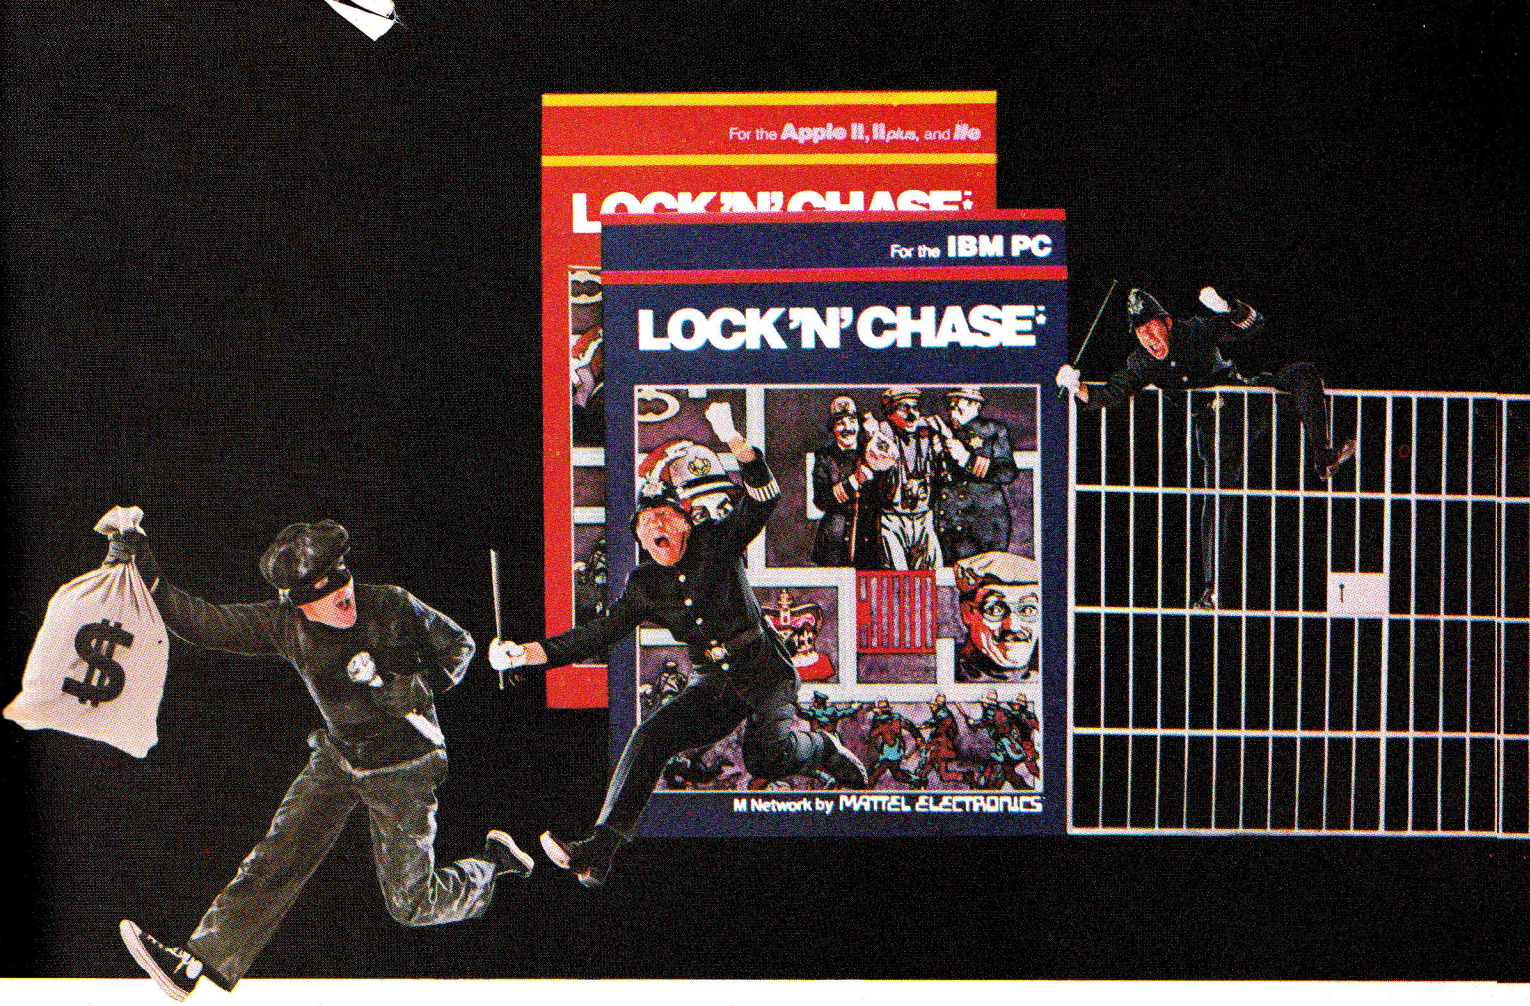

Concrete research on video games and education was scarce too, although B. David Brooks, a former high school principal, did survey 973 video game enthusiasts between the ages of 10 and 18. Poor grades, truancy and drugs and alcohol seemed not to be a problem with those surveyed.

Some educators and researchers, including David Perkins, believe that video games provide a motivation to learn that cannot be matched by textbooks or traditional classwork. Perkins pointed out that gaming formats offer immediate feedback, simulation and fantasy worlds—all of which he identified as important motivating factors. And video games can also make abstract concepts more comprehensible with the use of concrete models. Example: In Rocky's Boots, electricity is seen as a red color that flows through the circuits that the player has constructed.

Perkins also discussed some of the problems video games pose. One of the more interesting questions facing educators is the problem of contextual welding—a term that should be explained, not defined. Let's say, for instance, that a child learns some trigonometry while playing an educational video game. Will he or she then be able to recall the knowledge and apply it while building a house? Or is it possible the information learned can only be retrieved while sitting in front of a computer?

In the waning hours of the conference, Herbert Kohl, an educator and author of such books as *Thirty-Six Children* and *Math, Writing and Games in the Open Classroom*, wondered if computers and video games might become another factor dividing the rich from the poor. "While the poor pop their quarters into the arcade machines, the rich might very well be learning how to program games on their Apple IIs."

Educators and social scientists should examine the problems associated with video games and learning. And questions of social equity must also be asked. But it is foolish to deny the positive aspects of video games. Computers and video games are here to stay. Just how they will shape our lives, and the lives of our children, cannot be answered right now—not even by the experts assembled at Harvard last May. ■

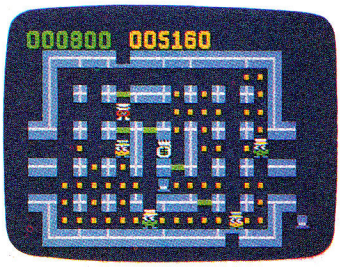

Introducing Lock 'N' Chase™* for your Apple and IBM. It'll give you a run for your money.

No, it's not a computer scheme to beat the stock market. It's Lock 'N' Chase™* from Mattel Electronics. For your Apple® II and IBM® Personal Computers. The computer game worth its weight in gold.

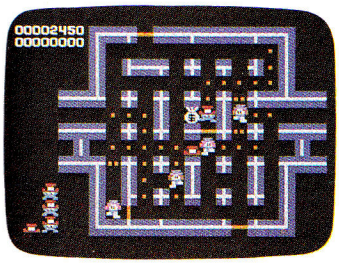

Picture yourself in a bank vault helping yourself to gold bar after gold bar. Tax free!

But here come the cops! And the chase is on. While you try to slow your pursuers by slamming locked doors on them.

Lock 'N' Chase™* from Mattel Electronics. Good as gold.

Apple® II, II Plus, and IIe

IBM® Personal Computer
Coming soon.

Letters

Apple's Edsel?

I am a new subscriber. . . a new owner of a computer (Apple III) and as a matter of fact, a newcomer to this entire "computer craze"!

The way I bought my Apple III this past December was that I engaged my accountants to research what I needed and they recommended the Apple III because of its memory capacity. A week later I picked it up at the store and brought it to my office.

Now that the machine has become part of our office life, all I read and hear about are the Apple IIs. When a word is said about Apple IIIs, it is usually some remark which makes me feel I have bought an. . . Edsel!

So far, I figure I have close to $10,000 in this Apple III project (including software) but that is *nothing* compared to the $30,000 to $50,000 I estimate I've lost in business because we have all had to learn computers around here instead of doing financial planning like our business used to be!

Having this tiger by the tail is frustrating me more and more every day. If I've bought a "dog" and I don't need all this extra memory after all, I'd like to know about it and dump it as soon as possible and at whatever price I can get. As I said, the original investment was peanuts compared to the expense of learning to use this machine.

Believe me, if Lisa can be learned in one-third the time, it would have been cheaper for me to buy three of them—even at $10,000 apiece—than it has been to buy this Apple III!

Your magazine is great, judging from the five back issues I've managed to borrow, and it has helped me a lot in my learning process. I now look to you for assistance.

I am sure that somewhere in your back issues there are articles about the Apple III that will help me decide if I've bought the right machine or not. Your editorial in the June issue made me think that perhaps I bought too much computer to begin with, and perhaps an Apple IIe or a Macintosh would have been just as suitable and easier to learn, as well.

I don't care if the articles are for or against Apple III, just as long as I can learn something from them. It would be great if I could find something comparing the Apple IIe and Apple III because unfortunately, I will be needing a second computer within the next six months and this one I want to make sure I choose myself!

F. Javier Banos
5837 MacArthur Blvd.
New Orleans, LA 70114

The III is not without its friends. In fact, our July issue's "Fermentations" column consisted of an eloquent and cogent defense of the machine written by inCider *columnist Bill O'Brien. Presumably, you have had a chance to read Bill's comments and thus you should now have information to help make a logical buying decision.*

Catty Remark

The CAT.FACE program (June) is written in Apple Logo. It has a BEGIN procedure that is most useful and should be a part of a Logo user's library. After changing the program to Terrapin Logo, I wanted to share my conversion of the BEGIN procedure:

```
TO BEGIN :X :Y :HEADING
PENUP
SETXY :X :Y
SETHEADING :HEADING
PENDOWN
END
```

No brackets are needed when putting in the variables; however, parentheses are used around the minus coordinates. The SETCRUNCH command used in Apple Logo is the .ASPECT command in Terrapin. The ratio decimals are the same.

Edna Mae Miller
576 S. Cole Ct.
Lakewood, CO 80228

Right! And we have resolved to treat Logo more ecumenically in the future.

Things Salesmen Don't Tell You

If you have an Apple IIe you can use your shift key just like a typewriter by using Applewriter II and a few simple keystrokes. Here's how:

1. Turn on your IIe with the caps lock key on. 2. When in the data line screen press Control and the "up arrow" key. "E," the first letter in the data line, has been changed to the desired "U." This "U" is the secret to shift key operation. 3. Release caps lock and type away just as you would on any typewriter. Upper and lower case appear on the screen and on the hard copy.

The Applewriter II manual—originally prepared for the Apple II + and not the IIe—doesn't give a clue to this super timesaver. Our "expert" computer salesman was misleading in telling us we could not get normal shift key operation using Applewriter II software without shift key modification.

Great magazine, folks. When we subscribe, how can we get back issues?

David Chui
Michelle Rousseau
2212 Metcalf
Honolulu, HI 96822

Thanks for the little "key note."

For the benefit of you and the many readers who call in asking for back issue ordering information, here's how to do it. Total cost for each issue is $4.50 (prepaid, please). This figure includes a $1 shipping/handling fee. Mail orders should be sent to inCider, *Back Issues Dept., Elm Street, Peterborough, NH 03458. Credit card orders are accepted over the phone at (800) 258-5473.*

Liberal Benefits

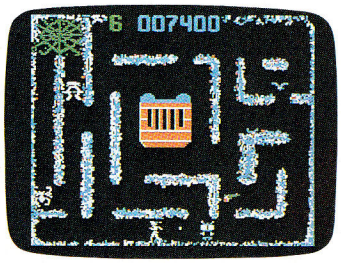

Wayne, I don't believe that a liberal arts education leads, as you said in a recent Hot Cider column, "nowhere." I suspect that countless liberal arts college graduates share my belief that there is real value, albeit intangible, in a broad educational experience. Some of these graduates no doubt subscribe to your magazine—are your clients or customers. Some of them are quite successful, even though they may have begun

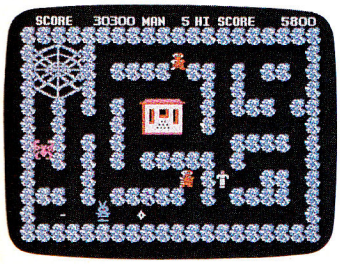

Introducing Night Stalker™ for your Apple and IBM. No wonder some people are afraid of computers.

Now there's a computer game that'll leave everyone hanging from the rafters. Nightstalker™ from Mattel Electronics. Now available for your Apple® II or IBM® Personal Computer.

After all, what could be more fun than being trapped in a cave full of bats? How about being trapped in a maze as well. Underground.

Apple® II, II Plus, and IIe

IBM® Personal Computer

And as if that weren't enough, you've got to watch out for gigantic DDT-resistant spiders. And extremely anti-social robots. Your job? What else? Get them before they get you.

Nightstalker™ from Mattel Electronics. Working nights will never be the same.

SERIAL PORT EXPANDER AND MORE

BTA's MODEL 524 MULTIPORT CONTROLLER is a code activated one to four serial port expander — but that's not all since it has separate and independent UARTS, buffers and handshaking each port can operate with a different configuration, i.e. different baud rates, stop bits, etc. These features also permit two or more devices to communicate with the 524 simultaneously.

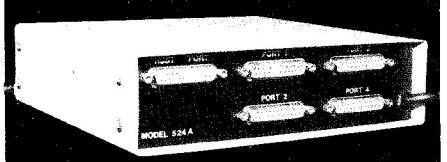

Full duplex with EIA RS-232 protocol

Baud rates up to 19,200

Expansion to 16 ports by cascading

Peripheral ports may be configured by user software

One year warranty

- **MODEL 524 . . . . . $249.00**
- **MODEL 524A $279.00**
  same as model 524 except has 256 byte rx/tx buffers per port
- **MODEL 524 D $269.00**
  same as model 524, plus continuous polling of each peripheral device for data transfer requests. The device is automatically connected when its 'turn comes up . ON, BUSY and OFF messages are sent to the peripheral device.
- Other models available — Contact us or your dealer for additional information.

with the initial "disadvantage" of a liberal education. This non-vocational education didn't teach these people to "put this wire here," "balance this column," "meet this quota" or "design a chemical to kill this." But, it seemingly prepared a lot of people to deal perceptively with the subtleties of living. Some were made the bigger for it. I guess what you consider to be an effective tool for living depends on your background and point of view.

K.R. Rumery
Associate Professor of Music
Northern Arizona University
Box 6040
Flagstaff, AZ 86011

Doubtless. However, if we are going to turn out the technicians and engineers we need to compete with Japan we'd better make some serious changes, and soon. We already have enough liberal arts colleges and precious few technical schools—and no colleges of the sort that I have been talking about. Our high schools, if they are doing their work, should turn out students with liberal arts training. I know that my high schools did well with this a few years back, with first-rate art courses, poetry workshops, literature appreciation and so on. I learned to read and write music in the third grade, the elements of art composition in the fourth grade, and music appreciation in the sixth grade. If the grammar and high schools have dropped liberal arts let's get them to get them back again and not load up the precious college years with 'em . . . particularly for students interested in cram courses in technology and business.

—Wayne

Sure, We're Game!

When I subscribed to your magazine I was hoping for some games as well as other types of programs. However, while you have upheld my expectations for non-game listings (especially POKE programs) I would really like to see some more games.

Jeff Bruno
436 W. Mariposa Ave.
Stockton, CA 95204

Yeah, we'd like to see more game programs too! How about writing a few for us? (The pay's not half-bad.)

Hidden Goody Revealed

This is just a short note from an old Apple user who thinks *inCider* is among the best of the Apple journals. I've only read three of your editions so far but the magazine looks like a winner.

I particularly enjoyed Greg Glau's fine review of the Magic Window II word processor in the June issue. I have owned this word processor for six months but it was not until I read Mr. Glau's review that I learned about one of the best features of the package that, somehow, I had overlooked in the instruction manual. I wrote to Mr. Glau asking for further

information, and his response was rapid, thorough and generous.

Richard Thompson
Highway 5, Box 31
Waldorf, MD 20601

Potpourri

First, you have a fine magazine. . . it is the only one I read about my Apple II. However, it is frustrating to not see answers to some of the readers' questions you print. If they are important enough to print, they should be important enough to answer.

Second, how about a few articles that compare products in a heads-on competition a la *Consumer Reports*? A table comparing the features of each product without all the advertising hype would enable a reader to select the right peripherals for his application and price range.

Third, your last issue arrived just in time to help me decide that I would wait for the new Buffered Grappler +. Thanks.

Fourth, how about tapes or disks for each issue, similar to your Load 80 tapes for *80 Micro*?

Fifth, why do manufacturers feel it is necessary to reinvent the wheel every few years? If early television had been "improved" like this every few years we would all be watching newsreels at the Saturday matinee; improvements in that industry did not render the older equipment obsolete. Despite some rumors to the contrary, I feel that as long as Apple Computer supports the II it will be around for a long time.

Jesse T. Humple
P.O. Box 1252
Carson City, NV 89701

O.K. Jesse, from the top:

First, you're right. . . there is an unspoken obligation to not leave the reader dangling in mid-air, waiting for the answer that never comes. Look for a brand new column dedicated to reader problems in the very near future.

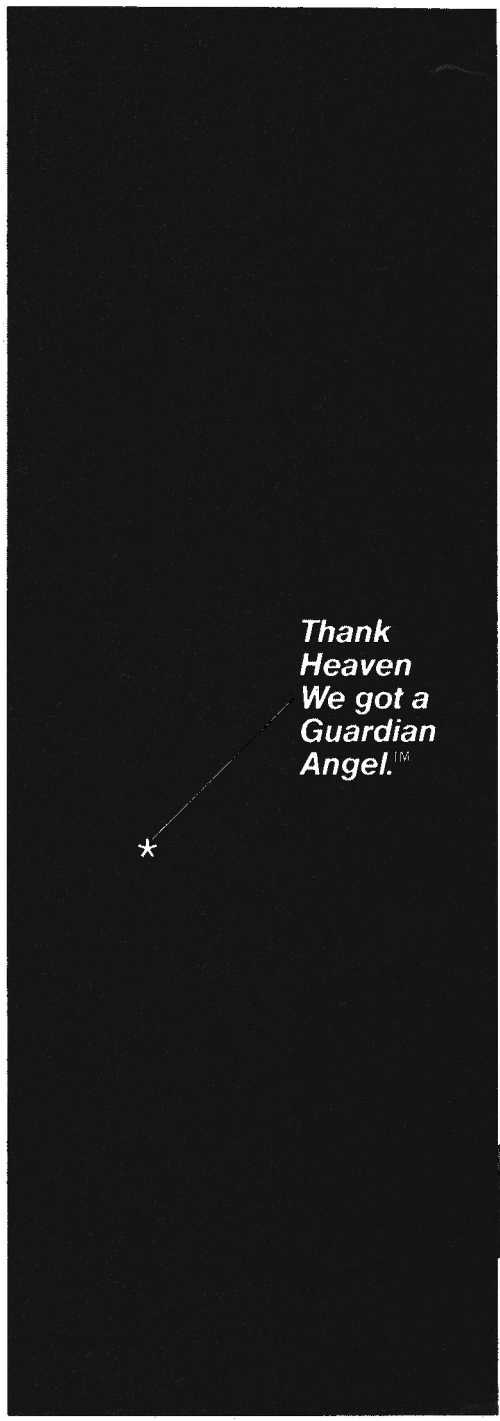

Second, somewhere deep in our cavernous "IN" basket is the blueprint for an ongoing series of buyer's guides which, as you suggest, compare products point-for-point in an objective format.

Third, you're welcome.

Fourth, we're closing in on that project. Trouble is, to do this thing right requires a significant amount of lead time. Moral: It is better to go slowly than half-fast.

Fifth, maybe the wheel is not being reinvented but is merely being perfected instead. (What's that old saw about he who does not advance retreats?) But rest easy, there are several hundred thousand IIs out there and it's highly unlikely that such a market will be dropped for a long time to come.

"POWER FAILURE"

Goodbye valuable data. Unless you have a Guardian Angel uninterruptable power source on duty.

Guardian Angel switches to 150 watts of backup power in 1/100 of a second or less while alerting you of blackout or brownout conditions. Its rugged 12V battery gives you up to six minutes (15 at half-rated power), enough to save your data and shut down your system if line power does not return.

Guardian Angel is compatible with virtually every major microcomputer system, including Apple, IBM, H-P, TRS-80, Xerox, Eagle and Osborne. Its transient voltage suppressor also prevents system damage from power spikes.

Guardian Angel simply plugs in between your power source and your microcomputer. Its compact size permits either desktop use or out of the way placement.

Protect your investment: see your R.H. Electronics dealer today about Guardian Angel or contact us at 566 Irelan Street, Buellton, CA 93427, (805) 688-2047.

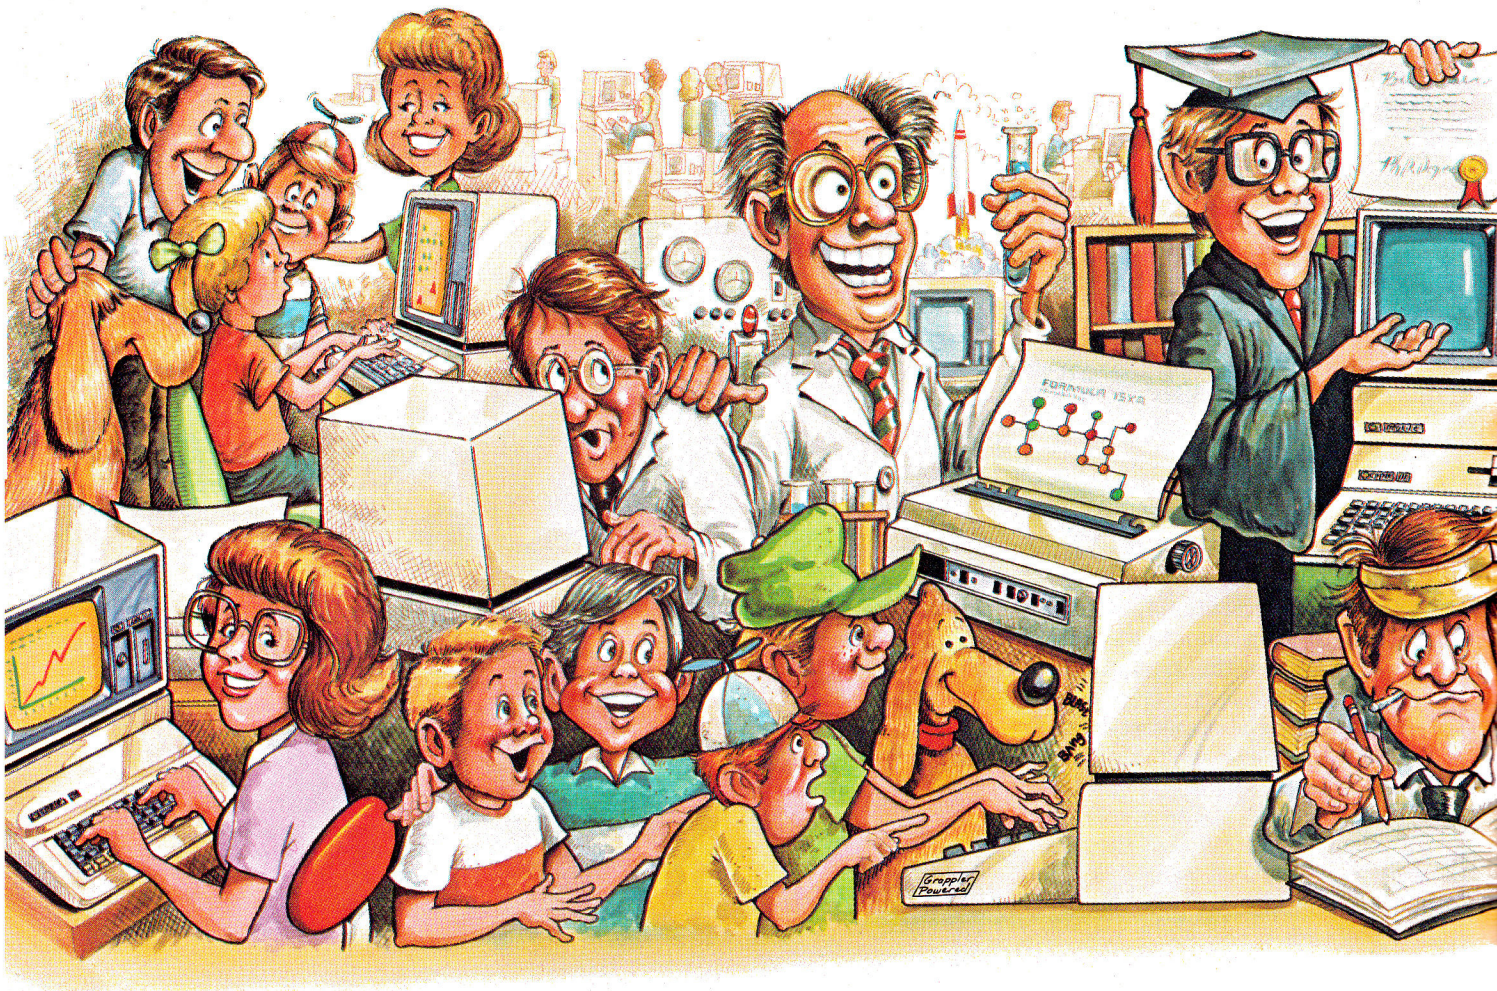

Guardian Angel*, with LED power status indicator, automatically safeguards data from blackouts, brownouts for just $595.

RHELECTRONICS, INC.

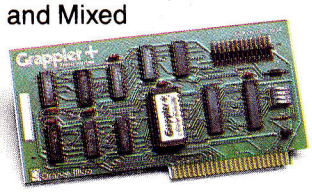

*Patents pending, UL listed, FCC approved, 240V/50 Hz version available. Dealers and OEM inquiries invited.

Satisfying Over
With Innovation

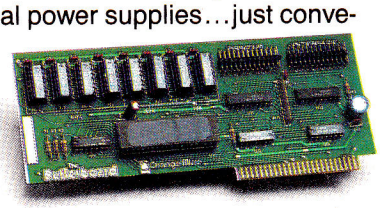

Grappler™ + Printer Interface

The Original Apple® graphics printer interface. Since its introduction three years ago, the Grappler has been imitated by many, but never matched. Now with Dual Hi-Res Graphics for side by side reproductions and Mixed Mode screen dumping, the Grappler + remains the most intelligent interface available. Over two dozen commands give Apple users full control over any graphics or text on the Apple Screen, including a new 80 column text dump. Performance, reliability and support have made the Grappler + the #1 selling intelligent Apple interface.

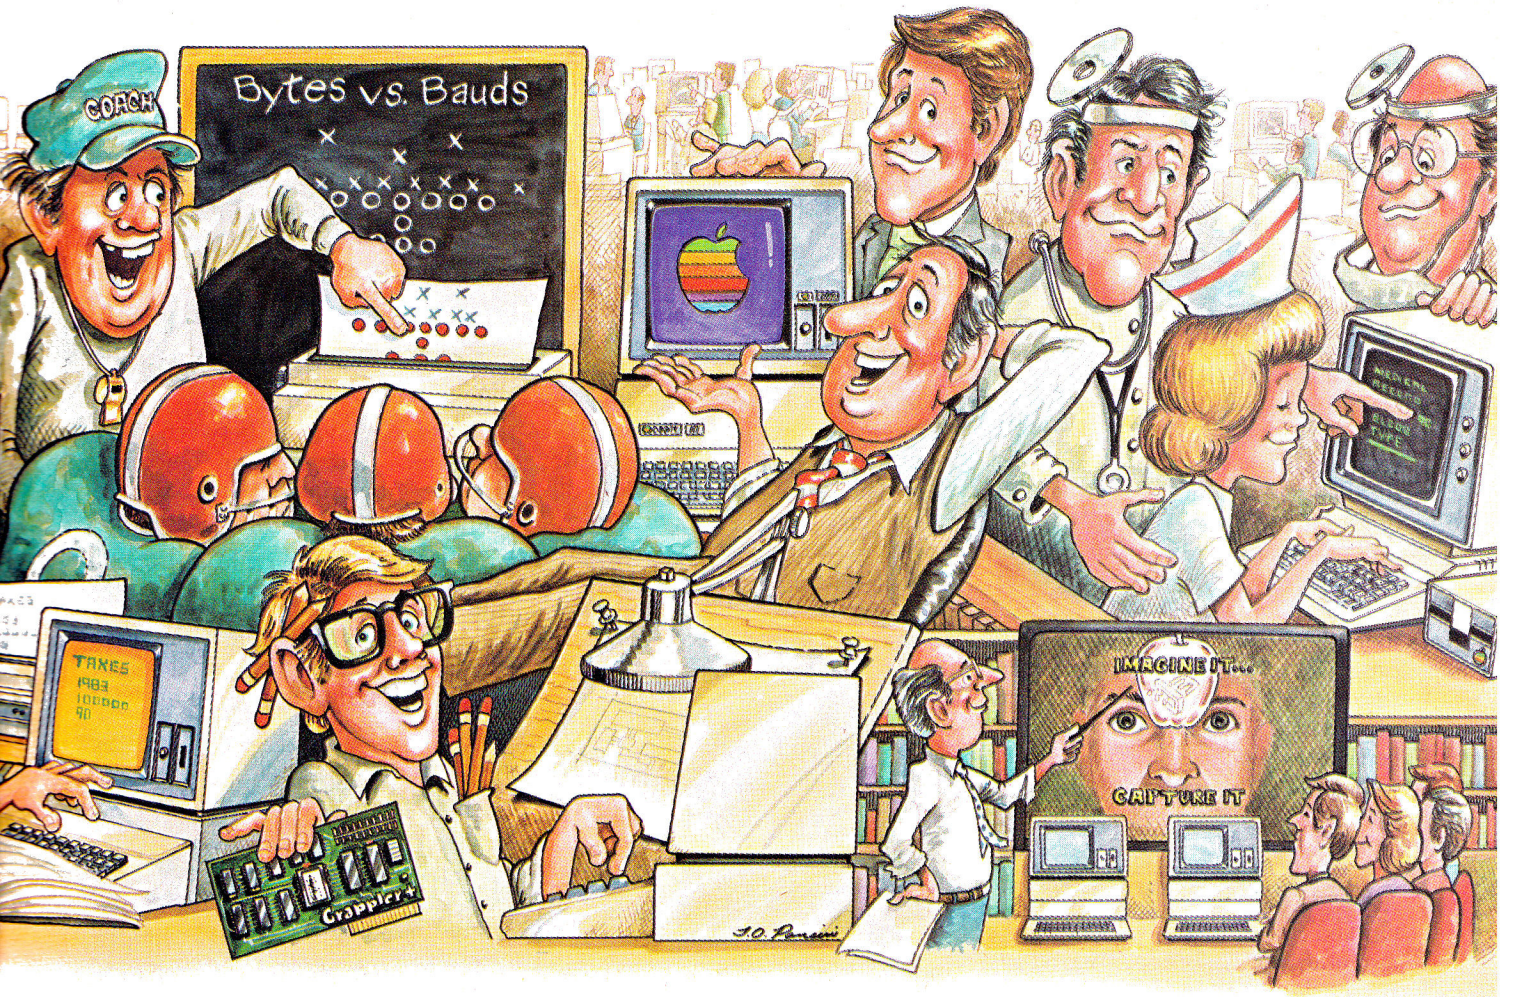

Bufferboard™ For Apples and Printers

The economical way to add printer buffering. The Bufferboard easily adds memory to your current Apple interface system, freeing your computer for additional input. Easily upgradable from 16K, the Bufferboard can store up to 20 pages of text. It fits neatly inside your Apple, "Docking" onto your existing printer interface.* No clumsy boxes or cables, no external power supplies…just convenience and economy. With the Bufferboard, you might never wait for your printer again.

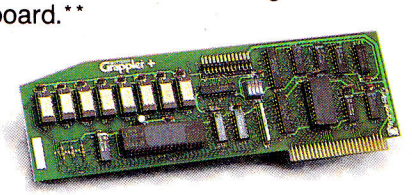

*Versions for standard Grappler + , Epson APL and Apple Parallel Interfaces.

75,000 Apple® Owners And Excellence.

BUFFERED Grappler + ™

The most sophisticated buffered Apple printer interface available. The New Buffered Grappler + combines the industry leading features of the Grappler + with the time saving economies of the Bufferboard.**

With this much interface power, you'll never need anything else. And the price will surprise you, too.

**Not available for IDS printers.
Apple is a registered trademark of Apple Computers, Inc.

Over 75,000 Apple computers are using Orange Micro products. Innovation and excellence have made us the #1 manufacturer of intelligent printer interfaces. The top selling Grappler + has become an industry standard, recommended by more software houses and Apple dealers. To meet the users' latest needs, Orange Micro is working to develop new products, like the color Grappler + for IDS color printers and the new Buffered Grappler + . There is an Orange Micro product designed for your application.

For a complete demonstration, see your Apple dealer today.

Techniques in Educational Program Design

Last month I mentioned I was looking forward to writing this column because *inCider* is featuring computers and education. The reason for my interest is that most of my working life has been spent in education. Before beginning my own microcomputer consulting firm, I taught science (chemistry mainly) at the college level for ten years. I introduced microcomputers as teaching tools in my courses and began writing programs to serve as additional instructional materials. Through this experience and the reactions and suggestions of my students, I developed several educational programs that I have successfully marketed nationally on a mail order basis.

Nor have I given up teaching. After leaving the college where I last worked full-time and moving to the mountains of Colorado, I found my knowledge of computers in demand by the local junior college and have been teaching evening extension courses for them. In addition, on several occasions I have taught a class for public school teachers called "Using the Microcomputer in the Classroom." It has been interesting to note how the enthusiasm for these courses has increased over the last two years.

It is with this background in educational philosophy and actual experience that I have established the set of criteria for judging educational programs and for setting goals for my own programs that I present here.

The Primary Objective

Before writing or evaluating a new program, you must determine what your particular objectives are for its use. Be very specific, and also identify precisely the student group that will be using the program. Add to your list of objectives the qualities the program must have to best meet their needs. If you do this with care, you will often discover that different groups need different programs to achieve the same educational goal. The differences between these programs will be relatively minor and easily implemented, and the effectiveness will be considerably enhanced.

For example, suppose you are designing a program to provide practice in solving simple division problems. You may have some students who already understand this material fairly well and some who are still having trouble with the multiplication tables, along with a group whose abilities are midway between these extremes. Your program objectives for the group having trouble with multiplication may include the following:

1. Simple division problems that result in whole number answers.
2. A dividend not exceeding three digits; a divisor of only a single digit.
3. Encouraging and sympathetic computer responses.
4. A "tutorial" element to review pertinent aspects of multiplication when a problem is missed.
5. Frequent use of the student's name.
6. Only the final score displayed when the student has completed the exercise.
7. The student to work 33 problems, worth 3 points each.

On the other hand, the program objectives for the more advanced students might look like these:

1. Simple division problems that result in whole number answers.
2. A dividend not exceeding five digits; a divisor of one or two digits.
3. Some funny, or even mildly sarcastic, computer responses.
4. Occasional use of the student's name.
5. A running score displayed after each problem is worked.
6. As many problems as the student desires, beyond a minimum of fifteen.

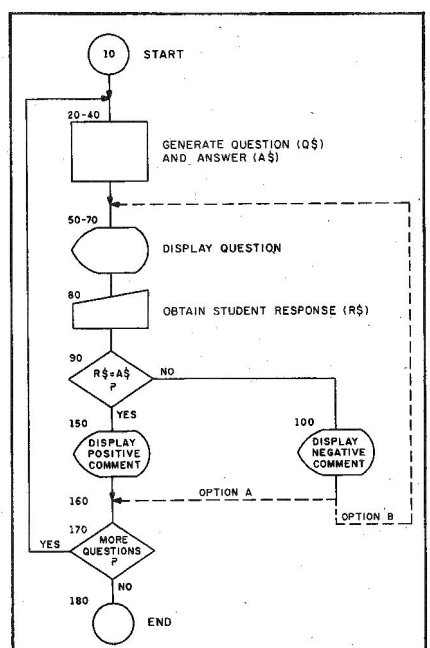

Figure 1. Basic flowchart for a drill and practice educational program.

Address correspondence to Dan Bishop, Custom Comp, PO Box 429, Buena Vista, CO 81211.

In both cases the educational objective, to provide drill and practice in the solution of simple division problems, is the same. The differences lie in how the program "treats" the student.

As another example, suppose the program were dealing with verb tenses as used in sentences. For a group that has reading difficulties, you may wish to make the sentences simple and the responses multiple choice. With an advanced group the same objectives may be better achieved by using more difficult sentences that involve intellectually challenging material, and by requiring the student to type in the correct response.

The Basic Program

Figure 1 shows a flowchart for the most fundamental of educational programs types, the "drill and practice" program. Here the computer merely generates and displays questions for the student to answer, accepts each response, evaluates the correctness of the response, and displays an appropriate comment before repeating the cycle.

In this form, the program has only limited use as an educational tool. Outside of the novelty of using the computer, nothing relieves the monotony of the question-answer cycle. Furthermore, the program only evaluates the response, with no instructional elements to help the student better understand the problem if the response should be wrong.

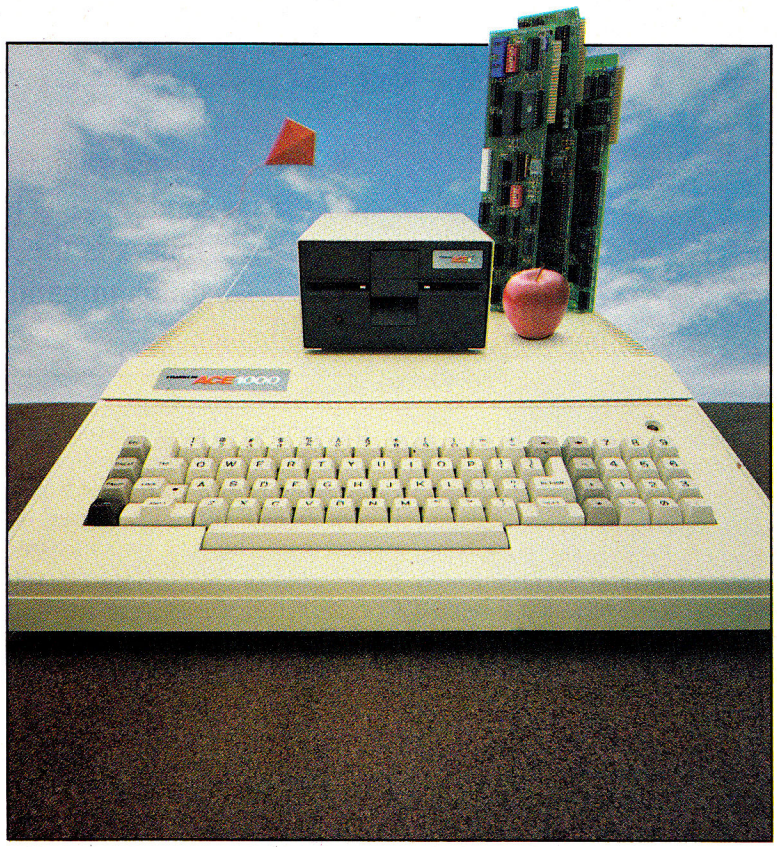

A choice between two approaches is shown in this flowchart. If the student is to retry a question until it is answered correctly, then the option B path in Figure 1 should be taken. If the program will just proceed to the next question, then option A should be used.

Listing 1 provides an example of this type of program, designed to generate simple multiplication problems. If you type this program in and use it, you will find yourself bored after a very short time. Your students will feel the same way; remember, they are human too!

As simple as this first program may

2128 Route 38 Cherry Hill, NJ 08002 Telephone: 609-482-5900 Telex: 837-385

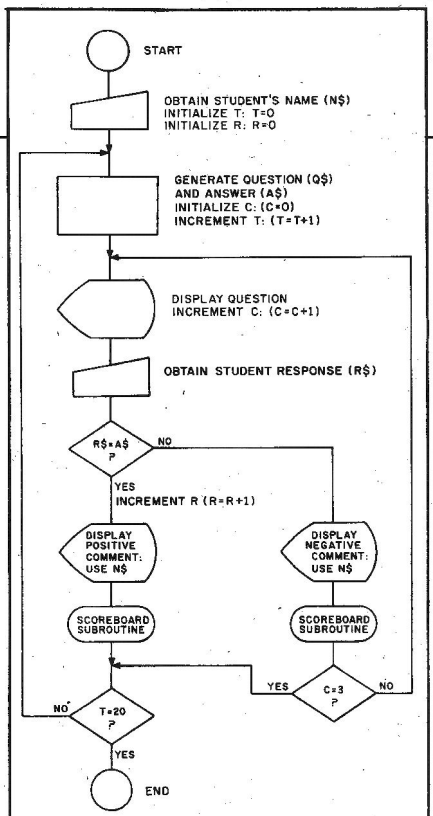

Figure 2. Flowchart for a more advanced drill and practice program. The format is the same as that used in Figure 1, with personalized comments and a scoreboard added.

be, it provides the fundamental structure for more complicated programs that have more versatility and can maintain a higher level of interest on the student's part. For example, suppose the following additions were made to increase this fundamental program's appeal:

1. Ask for the student's name at the start and use it in the program.
2. Display a running score after each response.
3. Give the student three tries at any question and then provide the correct answer.

Figure 2 is a flowchart for such a program. Notice the similarity between Figures 1 and 2. All of the elements of the first are still present in the second. The changes suggested are merely additions to the logic flow.

Listing 2 achieves the same educational objective as Listing 1, but with these new elements added. The program has been personalized by adding the student's name, and the student sees his score as he progresses through the twenty questions.

With this program, the variable T holds the total number of new questions presented, R counts the number of questions answered correctly (after up to three tries), and C keeps track of the number of attempts on each question so that any one question is never presented more than three times. The scoreboard subroutine uses only T and R so the first two incorrect responses to a question are not counted.

"The Basic instruction to use for a random selection of responses is the ON...GOSUB command."

Variety Adds Spice

Listing 2 is still a pretty dull program. As it stands, the student sees the same response each time a question is answered correctly, and for every incorrect answer, the same negative response appears. Using the technique described below and a little imagination, you can add a variety of positive and negative responses, selected randomly by the pro-

Listing 2. Drill and practice program that includes the student's name and a scoreboard. This example deals with the addition of four numbers.

gram. This can increase the interest level significantly.

The Basic instruction to use for a random selection of responses is the ON...GOSUB command. The three dots represent a randomly generated variable, and the word GOSUB is followed by a list of line numbers (separated by commas) that are the first lines of several subroutines. Whenever the random variable has a value of 1, the first subroutine from the list is selected. When the random variable has a value of 2, the second subroutine is selected, and so on.

For example, suppose the following line were inserted into the program just after the student's response (R$) has been accepted, but before the computer evaluates the response:

```
#### X = INT(RND (1) * 5) + 1
```

(The #### represents the actual program line number you would use in your Basic program.) This line generates a random value between 1 and 5 and assigns this value to the variable X.

Now use the following instruction in place of the PRINT line in your program:

```
#### ON X GOSUB 810, 820, 830, 840, 850
```

This command instructs the program to execute the subroutine at line 810 if the value of X is 1; if the value of X is 2, the subroutine at line 820 is executed; and so forth. Each of these subroutines is a simple PRINT command that provides a positive response, but each is different. For example, lines 810 through 850 might look like this:

```
810 PRINT "GOOD JOB, "N$". KEEP IT
    UP!": RETURN
820 PRINT "YOU GOT THAT ONE JUST
    RIGHT!!": RETURN
830 PRINT "FANTASTIC. YOU'RE HOT!":
    RETURN
840 PRINT N$", YOU'RE DOING
    GREAT!": RETURN
850 PRINT "I SEE A NOBEL PRIZE IN
    YOUR FUTURE!": RETURN
```

The response that appears on the screen will now be one of the five shown above, selected at random. Note that the use of the student's name in the responses occurs only two out of five times. This also adds variety, making the computer a little

There's just no end to the software available for Franklin ACE™ computers. Start with Franklin's own word processing and spreadsheet analysis programs. ACEWriter II and ACECalc. Sophisticated, yet easy to learn and use.

ACEWriter II was designed to take advantage of the typewriter-style keyboard of the Franklin ACE computers. And ACECalc, with a full 80-column display of variable column widths, lets you arrange data in a format that's manageable and easy to read, without squeezing or wasting space. ACECalc also allows you to create "invisible" fields. And to protect other fields from being accidentally changed.

And when you need more than word processing and spreadsheet analysis, you can choose from 16,000 more software programs, including accounting, payroll, inventory and purchasing. Even games. Because Franklin ACE computers are compatible with software written for the Apple® II.

more "human" in its responses.

The same technique can be used to replace the negative response PRINT command in your program. In this case, the type of response displayed can range from the understanding and encouraging, particularly for younger students, to the humorous and sarcastic for older students.

I had a college senior working with me one year, developing a program to help freshman chemistry students in calculating radioactive decay rates. One day she came into my office and said she was ready to have me give the program a try. I sat down at the computer and began answering questions, noting the variety of positive responses she had included in the program. Then I answered a question incorrectly, only to be confronted with BOY, YOU REALLY BLEW THAT ONE, YOU TURKEY!.

Needless to say, I was aghast. I would never personally confront a student that way, and suggested to my assistant that she might be coming on a little strong. But she insisted there would be no problem, and persuaded me to wait and observe the students' reactions. Their response, as it turned out, was quite favorable. The students were more than willing to take insults from the machine, and in some cases would purposely miss a problem just to see what the computer would say.

The point here, of course, is that using this technique allows you not only to add variety to the program, but also to tailor the program to the type of response acceptable to your own students. No longer are you at the mercy of the textbook publishing companies and their "generic" workbooks, geared to some national standard.

Listing 3. A math tutorial program dealing with simple division problems. This program contains multiple-response subroutines, a scoreboard, and a tutorial subroutine that is displayed whenever a given problem is missed twice.

Tutorial Enhancement

One thing I do not like about the "drill and practice" type of program presented above is that no real teaching takes place. Learning is enhanced by the practice and the repetition, but these techniques are most useful toward the middle stages of the process. The student must already be familiar with basic concepts to increase skills through such means.

At the earlier stages the student needs to receive some input with each problem missed in order to learn where he or she went wrong and how the problem should have been worked. If you add this capability to the standard "drill and practice," you expand the program's usefulness considerably, and it fits more appropriately in the category of "tutorial" programs.

It is interesting to note that adding tutorial features to a basic program can be done by merely adding a subroutine call between the negative response routine and the scoreboard routine shown in the Figure 2 flowchart. Thus, when a student misses a problem, the display communicates that, and then proceeds to show how the problem should have been worked. Then the scoreboard is displayed, and, depending on which option you have chosen, the program goes to the next problem or again presents the problem just missed.

In most cases, the tutorial is most effective if it deals with the actual question that was missed, rather than in general terms. Depending on the subject material, this may or may not be easily done. Mathematics and science problems are the easiest to han-

dle this way. The exact values used to formulate the problem are plugged into the tutorial explanation. It is also possible to add subroutines that are keyed to commonly committed errors, so that the program may be able to point out exactly what error was made.

Grammar problems may be restricted to appropriate definitions or generalized explanations during the tutorial phase, along with the correct answer (perhaps after the third try). Spelling problems might be least adaptable to the tutorial approach, with the tutorial phase being restricted to merely showing the word spelled correctly. Multiple choice questions could have an appropriate comment for each of the incorrect choices, adding information to amplify the subject material. This could help reduce the teacher's tendency to add ridiculous fillers as choices in a multiple choice test.

At this stage in the program, graphics displays may be suitable, especially if they emphasize the subject material. For example, a multiplication program might display a grid of asterisks across the screen with the number of rows and columns corresponding to the numbers being multiplied. A grammar program in which the student is to identify a noun might display the sentence on the screen with the noun in flashing mode.

Generating the Problems

I find math and science problems that deal with numbers the simplest to devise. By using randomly generated numbers the programmer can leave the specific problems up to the computer. For example, the following program sequence is all that is necessary to generate over 1000 simple multiplication problems in which the two multipliers ranged from 0 to 10 and from 0 to 100, respectively:

```
2000 M1 = INT(RND(1)*11)
2010 M2 = INT(RND(1)*101)
2020 A$ = STR$(M1* M2)
2030 HOME
2040 PRINT "WHAT IS "M1" TIMES
"M2"? ";
2050 RETURN
```

FRANKLIN dealers

The list goes on and on. Because Franklin now has more than 1,000 dealers throughout the country. From Savannah to Sun Valley.

What does that mean to you? It means that your Franklin computer system is backed by a growing company with an incredible dealer network from coast to coast. For stability. And service when and where you need it.

Our dealers are ready to show you Franklin's total solution. No more confusion over which software to purchase, what runs on which computer—and whether it'll really work. With Franklin, you have everything you need. Hardware. Software. Everywhere.

Where else, but at Franklin?

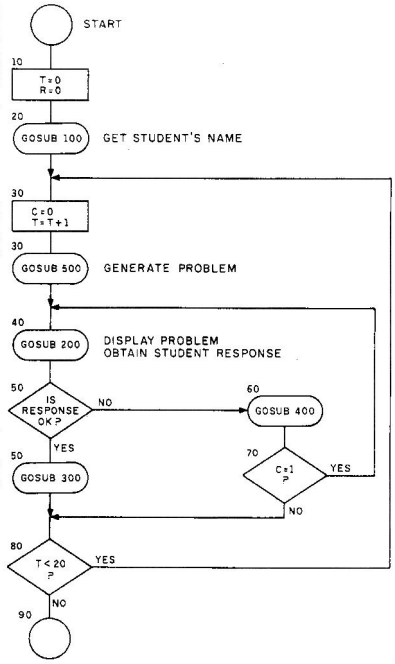

Figure 3. Flowchart for a modularized program. Compare this with Figure 1 and, after noting the similarities, compare Listing 3 with Listing 1.

A sample physics problem that requires the student to divide the mass of an object by its volume to arrive at the density can be set up as follows:

```
2000 D = INT(RND(1)*1930 + 1)/100
2010 IF D < .5 THEN 2000
2020 M = INT(RND(1)*100) + 1
2030 V = INT( 100 * M/D) / 100
2040 HOME
2050 PRINT"AN OBJECT HAS A MASS OF
"M" GRAMS"
2060 PRINT"AND A VOLUME OF "V"
CC."
2070 PRINT"WHAT IS THIS OBJECT'S
DENSITY? ";
2080 A$ = STR$(D)
2090 RETURN
```

Several aspects of this problem are important from a general point of view. First, since the problem deals with the real (terrestrial) world, it could be counter-productive to generate specifics representing a physical impossibility. Therefore, the densities generated must be restricted to values between 0.50 g/cc and 19.30 g/cc (the density of gold).

In order to generate values with two decimal places, the program produces a random number between 1 and 1930, and then divides that number by 100. As is often the case for math problems involving division, the result is generated first, and is then used to find one of the remaining numbers. Using this method, you could write a program to generate simple division problems that would always result in whole numbers.

In both examples above, although the answer is numeric in nature, the numbers have been converted to strings. This is not necessary, but the student response routine uses R$ for input so any keyboard character can be entered without causing unusual problems. For the first problem, the

WHEN YOU'RE BAN

evaluation of the student's response can be simply a comparison of A$ and R$, as follows:

```
IF A$ = R$ THEN ....
```

The second problem presents a more difficult situation, because you may want the answer to be correct only to the nearest + / − .02. If that is the case, then the evaluation should be handled like this:

```
IF ABS(VAL(A$) - VAL(R$)) =< .02
THEN...
```

Using this algorithm, you can set your own standards of accuracy on any math-oriented problem. Notice that the use of the ABS (absolute value) function takes care of the cases where VAL(A$) is larger or smaller than VAL(R$).

There are several ways of generating non-mathematical problems. The main obstacle here is that the computer cannot generate them randomly. Each problem must be entered as a unique part of the program. However, it is possible to add tremendous variety to the way that such a problem is displayed by using fairly simple techniques. Because of this, I plan to devote my next column to handling text-oriented problem generation. If your field is history, biology or language, please bear with me till then.

On Computer Literacy

One of the features of computer programs, educational programs in particular, most often neglected in program writing is the prompt that informs the user what to do next. For example, everyone knows that to get a program beyond a keyboard input routine, the user must press the return key, right? Unfortunately, that assumption is frequently wrong.

I have often seen teachers sit bewildered in front of a computer with the following simple command displayed on the screen:

```
WHAT IS YOUR NAME?
```

If a teacher can be perplexed by what appears to be a simple command, what about someone who has less experience, such as an elementary school student?

Compare the above display with the following:

```
PLEASE TYPE IN YOUR FIRST NAME
AND THEN PRESS THE <RETURN>
KEY...
```

This request leaves no room for doubt as to what is expected. Anyone who can read can follow these directions without hesitation.

Too many programs assume that when you have finished reading a display you will reach over and tap

the return key or space bar, or whatever, to continue. But without a prompt such as:

PRESS THE SPACE BAR TO CONTINUE...

how is the first-time user of your program to know what to do or why your program has apparently stopped midstream? Be specific and clear in your instructions. Your program will cause less anxiety and be more effective.

Simple Division

Listing 3 provides an example of the type of program I have been describing in this article. Its goal is to provide drill and practice in simple division problems in which the quotient (answer) and divisor must both be whole numbers between 0 and 12. In addition, a tutorial display graphically illustrates a given problem, should that problem be missed. Please note the use of subroutines as modules to accomplish specific tasks.

Figure 3 is a flowchart of the main program. If you compare it to Figures 1 and 2, you will find the basic program still intact. However, by using a subroutine module for each function, altering the basic program to handle other tasks becomes relatively easy.

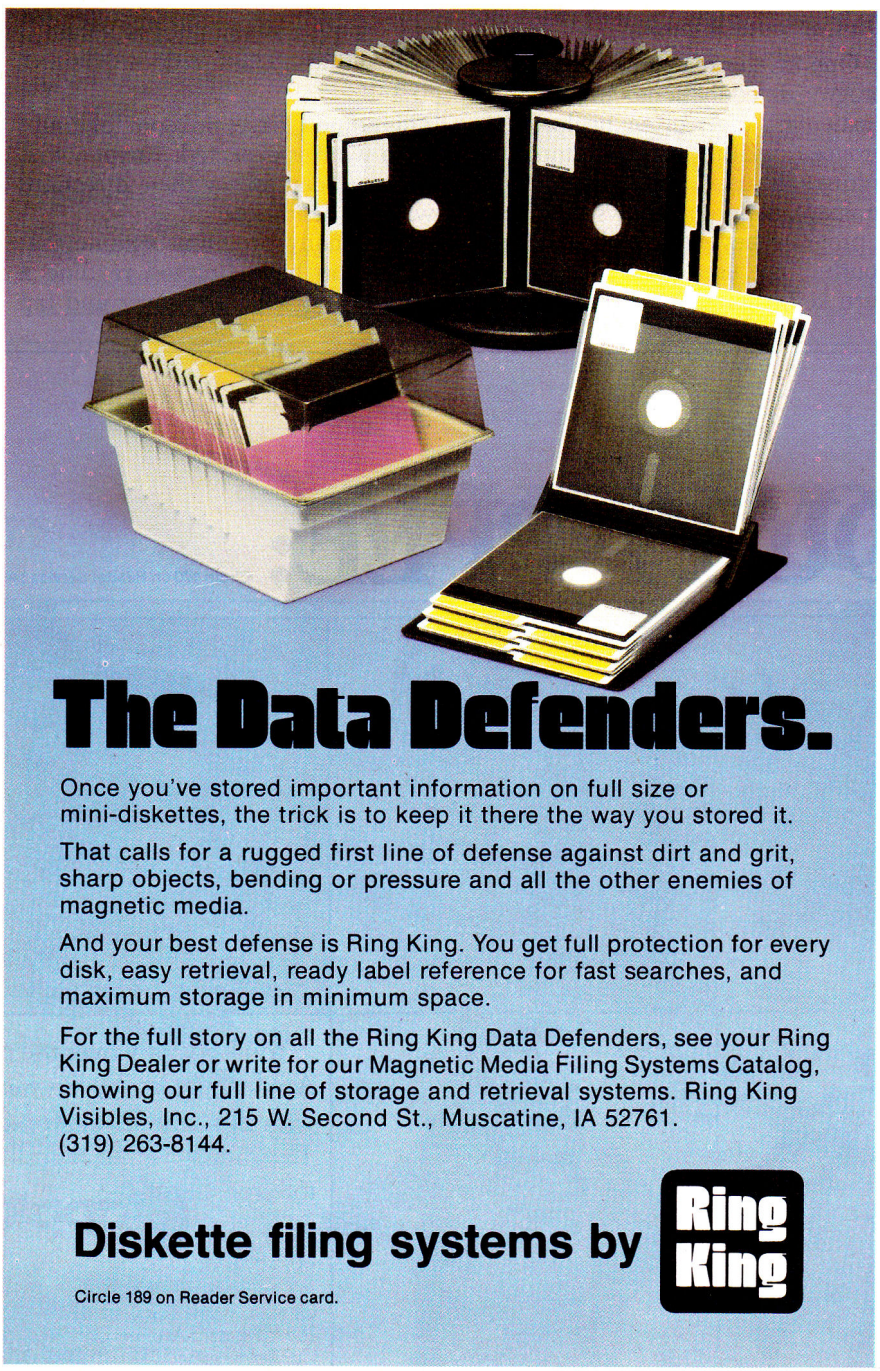

With generalization in mind, this program incorporates an additional variable, D, in the problem generation subroutine. This variable is used in the evaluation subroutine to specify the degree of precision with which the student's response must match the calculated answer. For this program that tolerance must be zero. That is, since the program deals with whole numbers, the answer must be exact. Other applications might allow more latitude.

In addition to presenting the number of correct answers, the scoreboard routine also calculates the percentage (rounded to the nearest one percent). The student is allowed two attempts on each problem, after which, if the problem still has not been worked correctly, the tutorial routine appears. If the problem is answered correctly on the second attempt, the student receives half credit for that problem.

Conclusion

The number of possibilities for educational programs is virtually limitless. Ideally the day will come when every parent, teacher and tutor will be sufficiently comfortable with the microcomputer to have a library of personally designed programs ready to use. Only then will the microcomputer have achieved its tremendous potential in the field of education.

Next month, as mentioned, I'll discuss program design features that can be incorporated into non-math-oriented educational programs. Keep this article handy, though, because I'll use the same basic program format. The main features to be changed are those relating to problem generation and response evaluation. ■

Introducing the Most Powerful Business Software Ever!

TRS-80™ (Model I, II, III, or 16) • APPLE™ • IBM™ • OSBORNE™ • CP/M™ • XEROX™

The VERSABUSINESS™ Series

Each **VERSABUSINESS** module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™ $99.95

VERSARECEIVABLES™ is a complete menu-driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALEDGER II™ and VERSAINVENTORY™.

VERSAPAYABLES™ $99.95

VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record on each vendor, prints checks, check registers, vouchers, transaction reports, aged payables reports, vendor reports, and more. With VERSAPAYABLES™, you can even let your computer automatically select which vouchers are to be paid.

VERSAPAYROLL™ $99.95

VERSAPAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government-required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on screen for operator approval. A payroll can be run totally, automatically, or the operator can intervene to prevent a check from being printed, or to alter information on it. If desired, totals may be posted to the VERSALEDGER II™ system.

VERSAINVENTORY™ $99.95

VERSAINVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSAINVENTORY™ keeps track of all information related to what items are in stock, out of stock, on backorder, etc., stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly or to link with the VERSARECEIVABLES™ system. VERSAINVENTORY™ prints all needed inventory listings, reports of items below reorder point, inventory value reports, period and year-to-date sales reports, price lists, inventory checklists, etc.

VERSALEDGER II™ $149.95

VERSALEDGER II™ is a complete accounting system that grows as your business grows. VERSALEDGER II™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system **without any additional software.**

- VERSALEDGER II™ gives you almost unlimited storage capacity (300 to 10,000 entries per month, depending on the system),
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALEDGER II™ comes with a professionally-written 160 page manual designed for first-time users. The VERSALEDGER II™ manual will help you become quickly familiar with VERSALEDGER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

SATISFACTION GUARANTEED!

Every **VERSABUSINESS™** module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any **VERSABUSINESS™** module, you may return it within 30 days for a refund. Manuals for any **VERSABUSINESS™** module may be purchased for $25 each, credited toward a later purchase of that module.

Straight talk about printers

Call for Prices

An inconvenience? Sometimes. We post the "call for prices" because manufacturers demand it. In fact, it makes sense to call anyway since our prices do change, usually for the better. Call toll free, **(800) 343-0726**.

Dot Matrix Printers

The Apple II/II+/IIe interfaces best in parallel, period. "Smart" interface cards produce graphic screen dumps. They're prefered if you can use them.

Check on software compatability *before* you buy the hardware—it's your responsibility. Call the software vendor or manufacturer & get some recommendations.

EPSON

FX, RX & MX

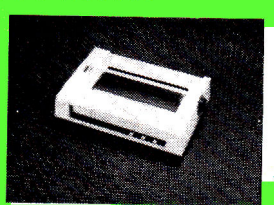

The **MX-80** is gone. In its place is the **RX-80**, which has 100 cps print speed. That's the only difference. **MX-80F/T**'s & **MX-100**s are still available, at least so far...

The **FX-80** is hard to get, but it is out there. It features 160 cps, a correspondence font & all the previous features of the old MX, including italics, emphasized print, etc... The tractor is optional. (The **FX-100** is the 136 column version).

C. ITOH

Prowriter

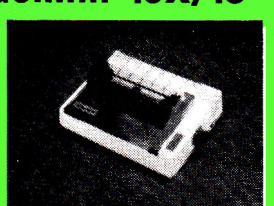

C. Itoh has produced a winner. The **Prowriter** has speed (120 cps), a buffer (1.5K), 10, 12, & 16 cpi (plus a correspondance font) and graphics (160x144 dpi). It's the printer of choice for several major OEMs (like Apple). The **Prowriter 2** has the same specs, but in a 132 column format. Popularity is its only curse: the **Prowriter** can be hard to get at times.

Prowriter **$399.88**
Prowriter 2 ..... **$719.88**

STAR MICRONICS

Gemini 10X/15

Gemini 10X is a new release of an old favorite. The 120 cps is the big change. They dropped the proportional font but kept the correspondance font. The 120x144 dpi, 5 fonts (w/italics) & 1K buffer are standard. **Gemini**'s comes with tractors & uses plain spool ribbons. The **Gemini 15** is the 132 column version. Call for the latest & greatest in prices.

OKIDATA

Microline Series

We use these printers in our offices. The **Microline 82A** (80 col) & **83A** (132 col) are data crunchers, with two interfaces (parallel or RS-232C), 120 cps, 10 & 16 cp (w/double-width) & optional dot-addressable graphics.

The **Microline 92** (80 col) & **93** (132 col) are ideal for word processing. They offer a 160 cps draft mode, a 40 cps correspondance mode & the dot-addressable graphics are included.

The **Microline 84** (132 col) combines speed (200 cps) with 10, 12, 16 cpi (w/double-width), all with a correspondance mode, plus dot addressable graphics.

Microline 80. ..... **$339.88**
Microline 82A **$419.88**
Microline 83A **$679.88**
92/82A Tractor **$59.88**
82A/83A ROMs **$49.88**
Microline 92. ..... **$524.88**
Microline 93A **$884.88**
Microline 84 ..... **$1024.88**

MANNESMANN TALLY

MT-160 L

The **MT-160 L** is the newest of the correspondence quality printers. It has speed (160 cps), 8 fonts (including a correspondance font), parallel & serial interfaces, friction/tractor feed, plus a menu-driven installation for easy set-up from the control panel—no more digging around for dip switches. It's remarkably compact & efficient, & the print quality is superior. This year's sleeper. The **MT-180 L** is the 136 column version.

MT-160 L **$689.88**
MT-180 L ..... **$CALL**

We sell other dot matrix printers, including the **Anadex WP-6000, DP-9501, DP-9620 & DP-9625** & **IDS's Prism 80, Prism 132 & MicroPrism**. You can call **(603) 881-9855** for technical details. For prices, or to order, call **(800) 343-0726**.

Letter-Quality Printers

Letter-quality printers are business machines, & very high-ticket ones at that. Most individuals should buy a dot matrix first, adding letter-quality when it's needed.

C. ITOH

Starwriter

The **Starwriter**, released last year by C. Itoh, has proven a worthy printer. You don't trade-off speed for price or quality. The **Starwriter** uses Diablo code, wheels & ribbons, has a 40 cps print speed, 1/48" line space, 1/120" horizontal spacing—ideal for proportional modes. (For real speed freaks, there's the **Printmaster**, at 55 cps. Same specs as above.)

Starwritter Parallel **$1219.88**
Printmaster Parallel **$1679.88**

DATA TERMINALS & COMMUNICATIONS

DTC 380Z

The **380Z** is a letter-quality printer that rivals and replaces the Daisywriter 2000. It has the 48K buffer, Diablo emulation & uses the Brother/Daisywriter supplies. The documentation is great, & the **380Z** even has pin-outs on the back for easy interfacing (parallel or RS-232C). Eat your heart out Daisy!

DTC 380Z (Parallel) **$1119.88**

SILVER REED

EXP-550

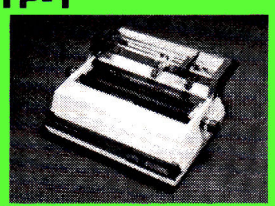

Why buy a Transtar when you can buy from the guys who make them? The Silver Reed **EXP-550** is a 16 cps, 132 column letter-quality printer with *true* Diablo emulation, making it compatible with most word processing software. It's ideal for medium duty office work. Add a buffer & you'll have a versatile printing system. If speed's not a factor, the **EXP-500** at 80 col & 12 cps is available as well.

EXP-550 (Parallel) **$719.88**
EXP-500 (Parallel) **$459.88**

SMITH-CORONA

TP-1

The **TP-1** is an ideal second printer for small offices or homes. The tractor feed (now available) enhances its paper handling. If you're letter-quality needs are light, this might be the machine. (Specify 10 or 12 cpi when you order.)

TP-1 ..... **$CALL**
TP-2 ..... **$CALL**

We sell a variety of other letter-quality printers, including the **Comrex ComRiter, Diablo 620 & 630**, the **NEC 3530, 3550 & 7730**, the **Qume 11+** & many others. Call **(603) 881-9855** for technical details. For prices, or to order, call **(800) 343-0726**.

Interface Cards

We carry several interface cards for the Apple. They all come with a printer cable, ready to run.

INTERACTIVE STRUCTURES

Pkaso

The **Pkaso** is our interface card of choice. It's dedicated to a specific printer, which means you'll get to use *all* the features on that printer. **Pkaso** can dump text or graphics from the screen, rotate graphics 90° to the printer, printing in 16 shades of grey (halftoning), etc. It has excellent documentation, plus a demo disk with utilities on it for VisiCalc, AppleWriter and others. Printers covered include the C. Itoh/NEC/Apple DMP, Epson MX/FX Series, Gemini 10/15, IDS Prism Series*, Okidata 80/90 Series & Centronics Series.

Pkaso Interface **$139.88**
*IDS Prism (Color) **$159.88**

ORANGE MICRO

Grappler+

The **Grappler+** is an excellent choice if you have more than one printer, but the **Grappler+** does not fully support every single feature on every printer. The **Bufferboard** lets you add 16K a print buffer, but only for the **Grappler+**.

Grappler+ **$149.88**
Bufferboard (16K) **$149.88**

APPLE COMPATABILE

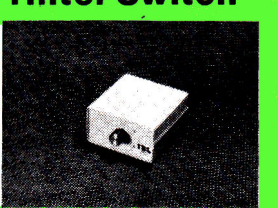

Parallel Card

We aren't stuck on a single vendor here. Tymac, Quadram or Microtek parallel cards all perform well.

Parallel Card. **$89.88**

TBL PRODUCTS

Printer Switch

We finally found a printer switch box that we like. Switch between two printers, in parallel/parallel or serial/serial versions (all female plugs).

2-Way Printer Switch **$119.88**

QUADRAM

Microfazer

Quadram's **Microfazer** is a stand-alone buffer that can be moved from system to system. The copy feature lets you print unlimited copies of a document. Comes with its own cable. The power supply is optional.

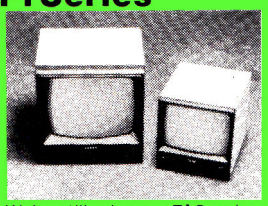

8K parallel/parallel **$154.88**
64K parallel/parallel **$219.88**
9 Volt Power Supply **$19.88**

Monitors

We can't imagine why people want RGB monitors on Apples or Franklins, but we get an order a month. Take our word for it—unless you're doing something unusual, composite video output is more than sufficient. As regards amber monitors, read on...

USI

Pi Series

We're *still* using our **Pi 3** amber monitor advertised last year. The concensus is yes, amber is easier on the eye. So is the **Pi-3**'s 20MHz bandwidth and sharp, clear phosphor. Comes in 9 or 12", & in green for you stubborn types.

Pi 2 (12" green) **$159.88**
Pi 3 (12" ambef) **$189.88**
Pi 4 (9" amber) **$159.88**

AMDEK

Color 1/300s

The **Color 1** offers the best color video output for Apple/Franklin we've seen. It's perfect for games & graphics, but like most color monitors it suffers in the text mode. It beats the bother of RGB, with its special interfaces.

The **300G** or the **300A** (green & amber respectively) offer 15MHz bandwidth in a monochrome display. Cosmetically superior to the Pi series.

Color 1 ..... **$339.88**
300A **$159.88**
300G **$149.88**

TAXAN

Monitors

A new product line that's getting raves. The RGBs are probably not for most of you. The green & amber screens are priced right. Good performers.

RGB-I (Med-res) **$319.88**
RGB-III (Hi-res) **$519.88**
KG-12N (12" green) **$129.88**
KG-12NUY (12" green) **$129.88**

Modems

Internal? External? 300 baud? 1200? Only you can answer these questions. 1200 baud makes sense if you're on-line during the day. If you're at home, on-line late at night, 300 baud may be all you need. As always, research this stuff *before* you buy.

US ROBOTICS

Password

Password represents state-of-the-art LSI technology. The small, compact case holds a 0-300/1200 baud. originate/answer, full/half duplex, auto dial/answer modem. **Password**'s operations are handled completely through software. Comes complete with a RS-232C cable.

Password **$379.88**

DC HAYES

Micromodem II

The **Micromodem II** is a 300 baud originate/answer, auto dial/answer, full/half duplex internal. It comes complete with all hardware & software. It's essentially an Apple/Franklin version of the Smartmodem, but with no 1200 baud upgrade in sight.

Micromodem II **$309.88**

Smartmodems are external units. Software & RS-232C cable are optional.

Smartmodem (300 baud) **$219.88**
Smartmodem (1200 baud)... **$539.88**

NOVATION

Apple Cat II

Answering the Hayes challenge, Novation swee ened the **Apple Cat** package with software & a free hour on the source. Originate/answer, auto dial/answer, full/half duplex, the **Apple Cat** can be upgraded from 300 to 1200 baud with an additional board.

Apple Cat II **$319.88**
1200 baud upgrade **$349.88**

Novation also makes external units. Call **(603) 881-9855** for technical details/specs.

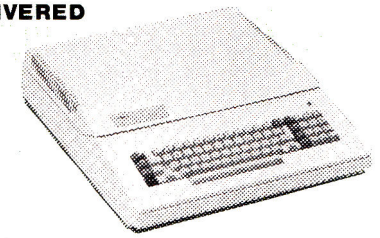

D-Cat (300 baud) **$159.88**
J-Cat (300 baud) **$139.88**
SmartCat
(300 baud) **$199.88**
(1200 baud) **$499.88**
AutoCat
(300 baud) **$229.88**
(1200 baud) **$629.88**

RS-232C Communication
Interface Board **$99.88**

Peripherals

The big question these days is IIe compatability. It's touch-and-go in some cases. You should check with the manufacturers to be certain, but also ask us—we're a gold mine of info sometimes.

FRANKLIN *Ace 1000*
$799.88 UPS DELIVERED

The **Ace 1000** is an Apple-compatabile computer with 64K RAM, hi-res graphics, 8 slots, a cooling fan, numeric keypad, 40 column w/upper-lower case & joystick ports. The ***Ace 1000*** can use any & all Apple II/II+ hardware or software—we've tested it in our showroom and sold many of these units with Rana Drives and Videx cards, to make whole systems. It's about as compatabile as any computer can be short of being an Apple. Definitely the bigger bang for the buck.

Ace 1000 ..... **$CALL**

MICROSOFT

Premium Pack

The Microsoft **Premium Package** includes the Z80 Softcard for CP/M™, Videx's Videoterm for 80 column display, a 16K RAMcard and Thom Hogan's book on CP/M™. If you're thinking about an upgrade, this is it.

Premium Package **$474.88**

If you've already got 16K RAM (Franklin, for example), get the Z80/Softcard Combo. Same spec's, but *without* 16K.

Z80/Videx Combo **$444.88**

Z80 Softcard **$229.88**
16K RAMcard **$74.88**

SATURN SYSTEMS

Accelerator II

The **Accelerator II** makes an Apple II run 3½ times faster than it normally does. We've tried it on our Franklin, and everyone's been impressed. High-speed 6502 processor and 64K memory. Comes with pre-boot.

Accelerator II **$409.88**

RAMboards by Saturn
32K Memory Board **$179.88**
64K Memory Board **$274.88**
128K Memory Board **$389.88**

RANA SYSTEMS

Elite-1

The **Elite-1**'s are single-sided, with 163K storage, 84ms access time & 13 or 16 sectoring—important points when choosing that second drive (you also get an Enhancer Disk free, which lets you access 5 extra tracks). The **Controller Card** can run four drives—Apples, Rana's or whatever—in any combination. The **Elite-2**'s are double-sided drives, **Elite-3**'s are 80 track drives.

Elite-1 ..... **$289.88**
Elite-2 ..... **$474.88**
Elite-3 ..... **$614.88**

MasterCard VISA AMERICAN EXPRESS

WANT PRODUCTS

The Micro Drive

The **Micro Drive** is a 5¼" floppy disk, half-height, for the Apple/Franklin computer. It's a single-sided drive, with 35 or 40 tracks that features direct drive technology, electronic write/protect, a 5 ms stepper motor and band positioning for unrivaled accuracy. The **Micro Drive** comes as a single unit, priced above, a stacked pair or two side-by-side (fits right over the case, & you can stack a monitor). Comes complete with cables & documentation.

The Micro Drive **$299.88**
Micro Drive (stacked) **$579.88**
Micro Drive (side/side)..... **$589.88**

VIDEX

VideoTerm

The **VideoTerm** 80-column card is something of a standard. It gives you 80-column display on the Apple/Franklin, with upper/lower case. It's a must for CP/M™ or Pascal. Comes with or without the Soft Video Switch, which lets you enable or disable the 80 columns from your keyboard.

VideoTerm w/switch **$234.88**
VideoTerm w/out switch ... **$204.88**

VIDEX

Enhancer II

The **Enhancer II** expands your Apple keyboard. Type-ahead buffer, repeat, shift/cap lock, programmable keys, full ASCII (upper/lower case) & more!

Enhancer II..... **$109.88**

QUADRAM

eRAM

An **eRAM** gives IIe users 80 columns and 63K of additional memory (1K gets used in the character set). This is particularly nice, since IIe compatability is rare these days.

eRAM Board **$119.88**

Information/Orders:
(603) 881-9855
Orders Only: (800) 343-0726

No Hidden Charges:

We pay UPS ground shipping on all our orders, and we *never* charge extra for credit cards. We accept CODs & add a $10 fee per order. We have a $50 minimum order. Personal checks are cleared in 3 weeks.

All our equipment is shipped with full manufacturer's warranty, & we sell only what we're authorized to sell to insure full warranty support. We're authorized for warranty work on a number of printers, & we also offer extended warranty plans for most printers.

Sorry, we cannot accept open POs or extend credit/terms at these prices. APO and foreign orders are not accepted.

We prepared this ad in June & prices do change, so call to verify them.

Our **Computer Showroom** is now open in Amherst, New Hampshire.

Interaction – A Child's World

by Michael A. Seeds and Kathryn Anne Seeds

Laughing Bear

Laughing Bear is a spelling game for children, but anyone might find it interesting because its utilities can be used in other programs and it illustrates certain ideas that are important in games for all ages. In particular, it contains a machine language music utility that plays short tunes and uses the two hi-res screens for animation. In case you don't have a graphics pad, a program called Plotter Zap is included that lets you draw pictures to the hi-res screen and save them to animate your own programs.

First a note about Laughing Bear (Listing 1). The program presents a child with short words selected at random from a list and invites him/her to type the word. As in any game, rewards are important, but especially when the player is a pre-schooler. The rewards in this program are a three-note phrase for each correct letter, a longer tune for a correct word and the face of a laughing bear as the player progresses. To maintain interest, the tunes become more complex after five correct words and again after ten words. After ten correct words the bear appears at random moments and winks at the child.

In addition to a carrot, the program also uses a stick—just a mildly ugly tone for a wrong letter.

One of us (K.A.S.) is three years old and thinks this game is neat, but it may not challenge *you*. Nevertheless, notice that the same structure of progressive rewards can be adapted to more sophisticated games and programs. In fact, you can use the same music program and animation methods to create alarms and blast space colonies to dust.

The music program, Tootle (Listing 2), consists of two parts. Part one begins at $30A and plays a single note whose period of vibration is stored in $306 and number of cycles in $305. Table 1 gives the data for a range of musical notes. The second part of Tootle begins at $326. It plays the list of notes stored at the address located

Note	Period(hex)	No. of Cycles in Quarter Note(hex)
D	51	3B
C	5B	34
B	60	32
A	6C	2C
G	79	27
F	88	23
E	90	21
D	A2	1D
Middle C	B6	1A
B	C0	19
A	D8	16
G	F3	14

Table 1. Musical notes data.

LAST NIGHT, 39 MUSICIANS HAD A COMPUSERVE CONFERENCE, SO DID 31 M.D.S, 49 SPORTS FANS AND 640 APPLE POLISHERS, AND NO ONE HAD TO LEAVE HOME.

The Electronic Forum, Cheaper than Long Distance and Much More Rewarding.

Every night on the CompuServe Information Service, professional and social groups discuss a wide range of subjects. From what's new in medical technology to what's nouvelle in continental cuisine.

And every day more computer owners who share a common interest are discovering this exciting new way to exchange ideas and even transfer hard copy data.

And besides electronic forums, they leave messages for each other on our national bulletin board, "talk" informally on our CB simulator, and communicate via CompuServe's electronic mail.

But best of all, in most cases, CompuServe subscribers get all of these state of the art communications options, plus a world of on-line information and entertainment for the cost of a local phone call plus connect time.

To become part of this flexible communications network, all you need is a computer, a modem and CompuServe. CompuServe connects with almost any personal computer, terminal, or communicating word processor.

To receive an illustrated guide to CompuServe and learn how you can subscribe, contact or call:

Table 2. Tunes hex dump.

at $006 (low order byte) and at $007 (high order byte). The tunes for this game are located in page $03 and are shown in the hex dump (Table 2).

Notice that Tootle is loaded automatically as the main program begins and that the calls to play tunes are illustrated in lines 1260, 1330, 2000, 3000 and 4000. The subroutine at 5000 is just a short delay necessary for us humans. I've used this program to generate all kinds of sounds, including alarms in programs that run laboratory equipment. Whether the sound is an alarm or a reward depends on its audio quality and on how you use it.

The graphic rewards in this program consist of two drawings of the bear's face. Bear 1 is the face with

Listing 3. Plotter Zap.

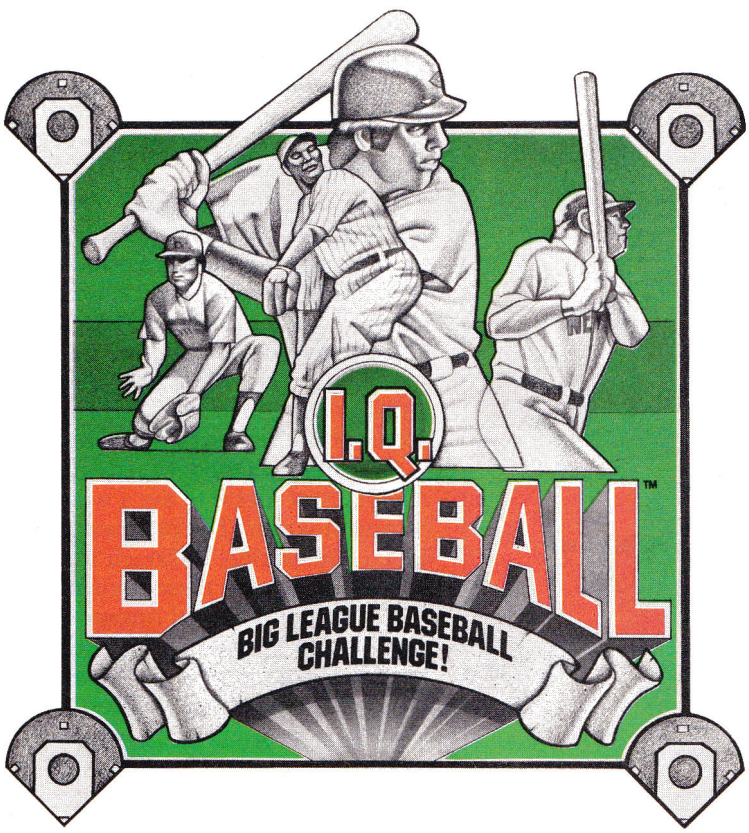

both eyes open, and Bear 2 is the face with one eye shut. Line 6000 displays Bear 1 and line 7000 switches to hi-res screen 2 to make the bear wink. Switching between pictures is a quick way to add action to simple games.

If you don't own a graphics pad, you can still draw pictures using a program like Plotter Zap shown in Listing 3. Use the I, J, K and M keys and move the cursor, turn the plotter on with the P key and off with the N key, and change colors by hitting space. You can save your picture to disk with the S key or load a previous picture with the L key. Notice how the main program loads pictures in lines 1053 and 1054.

You also can use the cursor from Plotter Zap in other programs. The subroutine beginning at line 4000 pokes the shape table into memory and you can then move a non-erasing cursor over your pictures and graphs. This is a handy feature for selecting specific data points from technical graphs.

Laughing Bear is just for kids and I hope your kids enjoy it. The programming methods behind the screen, however, are generally useful for programs of all kinds and programmers of all ages. ■

THE ONLY BASEBALL FACTS ANSWER-GAME!

Who hit the most homers in a 162-game season? If a ball hits the foul pole, it's a foul ball—True or False?

O.K., baseball buffs—this is your chance to play a high-res action-packed computer game that gives you singles, doubles, even homers...but only if you really know your baseball. I.Q. BASEBALL features realistic animation and the sounds and music you hear at a real ball park!

Play I.Q. BASEBALL on Apple II+/IIe with 48K and disk drive.

Only $24.95
(phone orders, add $2 for shipping & handling)

Available soon—Separate disks with questions on your favorite American League or National League Team. Or one entire disk of questions on the World Series. Only $14.95.

Ask for I.Q. BASEBALL at your favorite computer software store or order directly from DAVKA. Credit card holders may order toll-free. Dealer inquiries also invited.

Apple Interactive Testing

The new emphasis on individualized education brings with it a new burden—individualized testing. Using the Apple to administer these tests—when the student is ready—makes good sense.

I designed the Apple Interactive Quiz program to use a sequential text file named Quiz, which is full of test items that the teacher would like to administer to students. It will not create the test items for the file, so the burden of test creation falls on the teacher. However, once this sequential text file has been created, the Apple Interactive Quiz program does the administration and grading of the quiz.

Sequential Text Files

How can teachers create sequential text files and, specifically, what should be put in them? Here are a few references for those who might need them. Chapter 6 of the *Apple DOS Manual* is a good place to start. Also, the book *Apple Basic: Data File Programming*, authored by Finkel and Brown, is an excellent tutorial text on the subject.

One easy method of creating sequential text files is to use a word processing program. The program I use is called Superscribe, although it is now released under the name Screenwriter II. This program produces sequential text files and has excellent editing capabilities that make it ideal for creating and modifying Quiz files. If you already own a word processor pro-

Can you tell the IBM® from the Transtar 130?

A

Letter quality
standard of
the industry

5x magnification

B

Letter quality
standard of
the industry

5x magnification

One of these two print samples was generated by an **IBM Selectric II**: the letter quality standard of the industry.

The other was generated by the new **Transtar 130** letter-quality printer.

And print quality is just the beginning! The new Transtar 130 daisy wheel printer is also plug-and-go compatible with the best-selling word processing packages! It features bidirectional printing, superscript, subscript, underlining and a true boldface. Retail price? **Only $895.**

Quietly producing copy at 18 cps Shannon text speed, the Transtar 130 also features a unique autoload button to make printing on letterheads a breeze! Three new daisy wheels have just been made available for the 130 from your dealer: letter gothic (shown), script, and a 15-pitch "gothic mini"—perfect for printing spreadsheets to fit on one page!

Offering an end-user warranty period of a full six months, the Transtar 130 is an extraordinarily reliable machine. Its minimal failure rate runs less than 1%, but if your 130 should ever need repair, a nationwide network of authorized Transtar service centers stands ready.

Have you decided yet whose type is whose? If you picked A...You picked Transtar. The **new** standard for letter quality printing.

gram, check if it can create documents as text files. If your word processor writes only binary files, it will not create Quiz files for use with the Apple Interactive Quiz program.

Test Format

Whether you use a word processor or a program of your own design to create your Quiz files, you must know the format that constitutes a complete test item. Several University of Georgia associates and I have standardized our mutual programming efforts by using the following test item format. Regardless of the type of objective test item you desire to store in the Quiz files (multiple choice, matching, true/false or fill-in-the-blank) the computer will examine the contents of the files for two recurring flags. A XXX will signal the end of a question, and a STOP// will signal the end of the answer (the whole test item). In other words, each test item should possess the following four main parts:

1) question and (if appropriate) response choices
2) XXX
3) the correct answer
4) STOP//

A specific example of the correct format is shown below.

Who is buried in Grant's tomb?
A) C.S. Grant
B) U.S. Grant
C) John Jones
D) Fred Smith
XXX
B
STOP//

Each successive quiz item is simply a repetition of these four main parts. All test items should be typed in capital letters, but any necessary punctuation may be used in the questions and responses. Also, do not number the test items in the Quiz files, because the program will do this for you.

The System

When placed on a disk with your Quiz file, the two programs included here, Apple Interactive Quiz and Quiz Teacher Menu, constitute an interactive testing system.

INTRODUCING . . .

PORTFOLIO

THE GAME OF FINANCIAL FINESSE

Now, for the price of one share of stock, you can own the entire market !

★ **A totally new concept —** PORTFOLIO is a creative simulation of the investment world. To maximize your playing pleasure we eliminated the drudgework, and enhanced the most enjoyable aspects of investing.

★ **Simplicity —** PORTFOLIO is a learn as you play game. Go ahead . . . make a few mistakes. Your Apple® will show you how to correct them. And don't worry about decimal points. PORTFOLIO handles the financial aspects of each transaction automatically.

★ **Realism —** Market fluctuations don't just happen. They happen for a reason. PORTFOLIO offers a fully integrated system of influential factors, and gives you the power to research them, all at the touch of a button.

★ **Challenge —** Investment managers have millions riding on their decisions every day. So will you! Choose among stocks, commodities, business ventures and money market funds in an ever changing environment.

Quiz Teacher Menu

This program offers a menu with six choice options.

- Option 1 reads a sequential text file named Info. Since no Info file is included with this article, you may either delete this option or create an Info file of your own. I find it helpful for storing critical system information that I like to keep with a disk. In this case, you might store the Quiz file item format, any essential information concerning your disk security schemes and so forth.
- Option 2 initializes sequential text files named Users and Results. This option must be executed before any students take the quiz. In effect, it creates files for the storage of student data. This choice also reinitializes or erases the previous contents of these files in preparation for collecting data on each new quiz.
- Option 3 allows a teacher to enter a list of those students who are authorized to take the quiz. The Apple Interactive Quiz program checks this list and allows authorized students to access the quiz only *once*! The program does prompt for the student's name, but teacher-assigned passwords might be more appropriate. Also, be sure to include several extra passwords in your authorized list to accommodate future needs.
- Option 4 reads and displays the contents of the sequential text file named Users. A student's name is added to the Users file when the Apple Interactive Quiz program *begins*. Therefore, it becomes a record of all students who began the quiz.
- Option 5 reads and displays the contents of the sequential text file named Results. Students' quiz results are recorded at the *end* of the program. Thus, in this option the teacher views a record of all students who complete the quiz successfully. It should be obvious that any discrepancy between the contents of the Users and Results files indicates an interrupted quiz. Should this occur, question the student carefully concerning the test circumstances.
- Option 6 terminates the program.

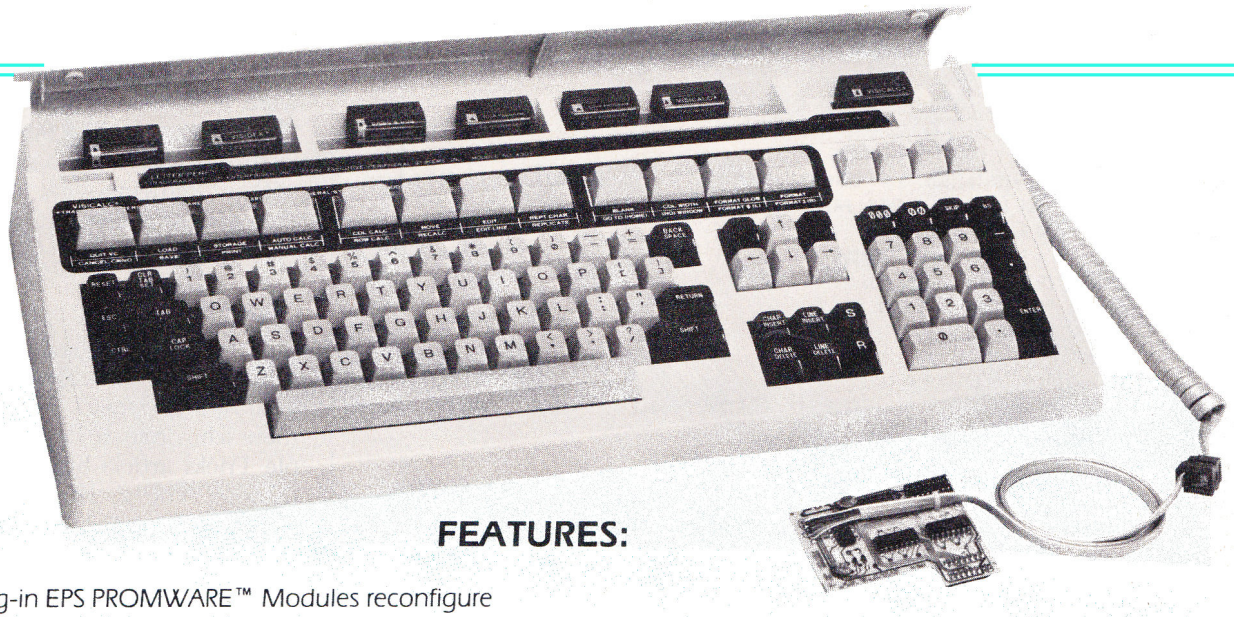

Apple Interactive Quiz

This program accomplishes the following major steps:

1) It warns the student not to remove the disk until the quiz is completed.
2) It presents general quiz instructions to the student.
3) It requests the student to input his/her name.
4) It records the student's name in the Users file
5) It administers the test items stored in the Quiz file.
6) It records the student's name and quiz results in the Results file.

This program possesses protection features that take effect once the program has begun to run. Line 120 disables the LIST command, and line 130 causes a reset to reboot the disk. For this reason, I recommend that the Apple Interactive Quiz program be used as the Hello program on a special quiz disk. Then, whenever the disk is booted, the program becomes unlistable.

Why Buy a Whole New System when what You Need is a Professional Keyboard?

FEATURES:

- Plug-in EPS PROMWARE™ Modules reconfigure keyboard for popular software packages, virtually eliminating complex command sequences.
- 12 Special Function Keys give up to 48 commands for popular software packages when used with EPS PROMWARE™ Modules.
- PROMWARE Modules available for WORDSTAR VISICALC*, APPLEWRITER II*, DBASE II*, PASCAL and other packages.
- Configure your own function keys when writing your own software.
- Unit comes with special BASIC and DOS commands which saves keystrokes.
- Interface Board plugs into keyboard socket on motherboard, no I/O slot required.
- 6 ft. cord and telephone style jack provide convenient placement and portability.
- Latching cover secures extra PROMWARE™ Modules and Command Templates.
- Full Word Processing layout—convenient and time saving.
- Word Processing Edit Keys (Delete, Insert, Find, Replace).
- CAP-LOCK, Working SHIFT Key.
- Auto-Repeat on all keys.
- Full cursor control with UP and DOWN arrows improves speed in spread sheet and word processing applications.
- 21-key Numeric Pad allows easy data entry.
- Works with APPLE II's, APPLE II + and FRANKLINS.
- Optional Softswitch allows added flexibility by enabling both the Apple and EPS keyboard to operate interchangeably.

Keyboard	$349.95
PROMWARE	$32.95
90-Day Warranty

These two features will not totally secure the quiz system, because a student could use a control-C and CATALOG sequence to inspect and possibly wreak havoc on the disk. However, if one were to disable or change the CATALOG command, then the control-C interrupt would be of no value, because, without knowing what programs exist on a disk, it is difficult to access them for any purpose.

Quiz Security

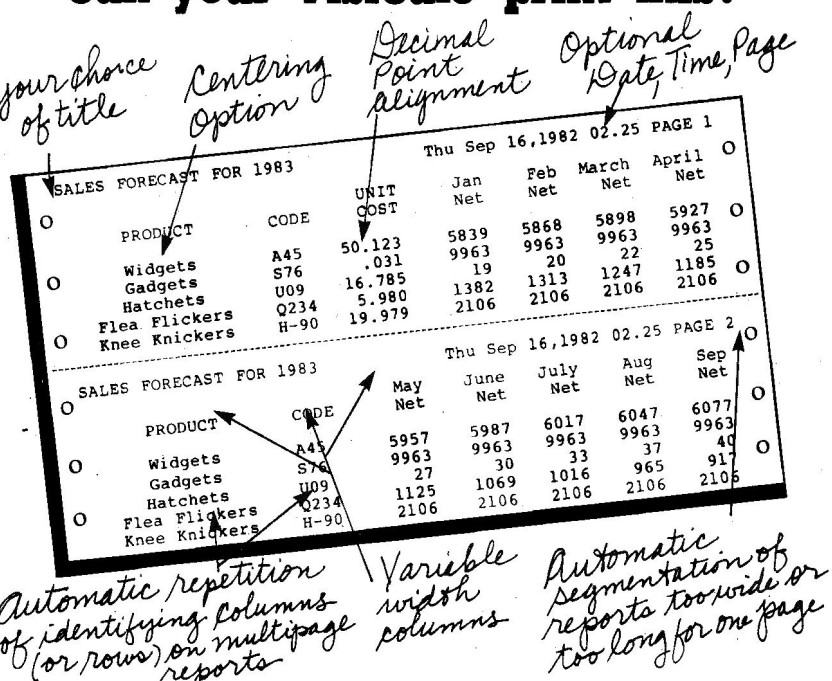

Here again, I will not attempt to describe how to change the DOS commands, but rather offer references for those who desire to do so. Read the Apple Tricks article by Craig Crossman (*Nibble*, Vol. 2, No. 3), or the Disk Commander article by Preston Black (*Nibble*, Vol. 3, No. 6). In addition, Beagle Brothers' DOS Boss program modifies the DOS on any given disk. By modifying the CATALOG, DELETE, INIT and SAVE commands on the quiz disk, one can effectively prevent user access to the disk's catalog and several other potentially troublesome functions. This is a successful protection scheme; however, if you modify the DELETE command, you will need to change two lines in the Quiz Teacher Menu program. Lines 810 and 1080 both delete files. If you change this command then be sure to substitute the new command word in place of the word DELETE in these two lines.

"Line 120 disables the LIST command, and line 130 causes a reset."

Only one small problem remains with our altered DOS quiz protection scheme. Each time a disk is booted, a copy of the DOS on *that* disk is read into the Apple's memory. As long as the modified DOS from the quiz disk is in the Apple's memory, the quiz disk is secure. If a normal disk is booted first, then the CATALOG, DELETE, INIT and SAVE commands will function normally. In addition, since the Apple Interactive Quiz program has not run (the

System Saver™

The most important peripheral for your Apple II and IIe.

For Line Surge Suppression

The SYSTEM SAVER provides essential protection to hardware and data from dangerous power surges and spikes.

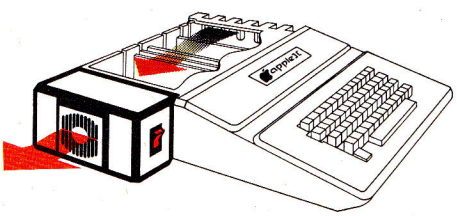

By connecting the Apple II power input through the SYSTEM SAVER, power is controlled in two ways: 1) Dangerous voltage spikes are clipped off at a safe 130 Volts RMS/175 Volts dc level. 2) High frequency noise is smoothed out before reaching the Apple II. A PI type filter attenuates common mode noise signals by a minimum of 30 dB from 600 khz to 20 mhz, with a maximum attenuation of 50 dB.

For Cooling

As soon as you add 80 columns or more memory to your Apple II you need SYSTEM SAVER.

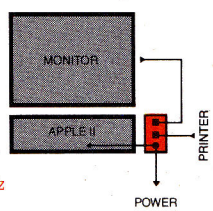

Today's advanced peripheral cards generate more heat. In addition, the cards block any natural air flow through the Apple II creating high temperature conditions that substantially reduce the life of the cards and the computer itself.

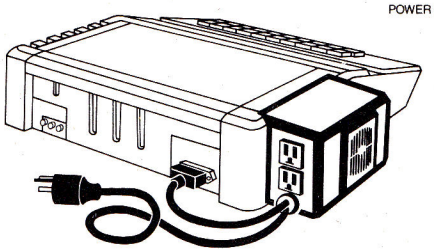

SYSTEM SAVER provides correct cooling. An efficient, quiet fan draws fresh air across the mother board, over the power supply and out the side ventilation slots.

For Operating Efficiency

SYSTEM SAVER contains two switched power outlets. As shown in the diagram, the SYSTEM SAVER efficiently organizes your system so that one convenient, front mounted power switch controls SYSTEM SAVER, Apple II, monitor and printer.

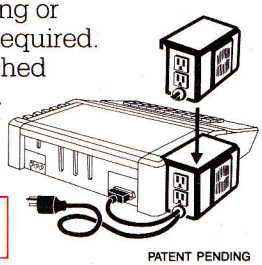

Available in 220/240 Volt. 50 Hz

The heavy duty switch has a pilot light to alert when system is on.You'll never use the Apple power switch again!

Easy Installation

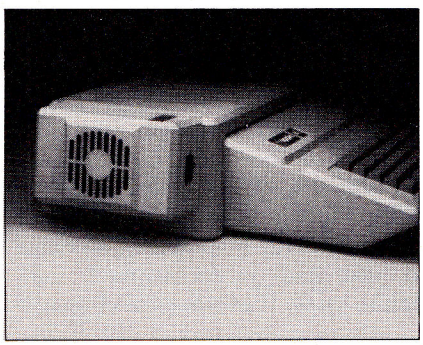

Just clips on.
No mounting or hardware required.
Color matched to Apple II.

DOS altered disk wasn't booted), LIST and RESET would function normally. So. . . why bother, right? Not at all. I've used this quiz system (with the DOS modifications mentioned above) extensively with high school students and have had no problems. I don't mean to imply that this level of security is adequate protection from the curiosity of all students, but it is *usually* sufficient.

Regardless of how you choose to secure your quiz disks, the Apple Interactive Quiz and Quiz Teacher Menu programs should make it quite easy to administer and manage them. ■

Logo Talks Back

One of Logo's special talents is list processing, which can transform your Apple into an AI machine. You and the kids will have fun chatting with your Apple—but be prepared for some saucy back talk.

by Donna Bearden and Jim Muller

Turtle graphics is a fascinating feature of Logo. It takes you from single keystroke exercises for preschoolers through college-level solid and spherical geometry exercises, studies of Newtonian physics, dynamics, as well as Einstein's general theory of relativity.

But graphics is only part of the fun of Logo. It also has some wonderful list and text processing capabilities that open up opportunities for word games, language programs, word processing, database management and a wide range of other applications. List processing can even be combined with turtle graphics to make the language even more interactive.

Let's start with a simple interactive program that will seem like the computer is carrying on an intelligent conversation with you. This is fun for youngsters to program and try on someone who is not familiar with computers. They don't need to know that all the questions and responses are preprogrammed. It's also fun for students to try them out on each other.

You'll find references to both Apple Logo and MIT Logo (versions are available from Terrapin Inc., 380 Green St., Cambridge, MA 02139, and from Krell Software, 1320 Stony Brook Road, Stony Brook, NY 11790) in the program listings. Thus you can use these procedures with any Logo for the Apple II computer.

Commands

PRINT: The PRINT command tells the computer to print on the screen whatever is inside the square brackets. For example, if you type PRINT [I AM A COMPUTER] and press return, the computer will print I AM A COMPUTER. Try the PRINT command with a few different inputs.

Sometimes you want a blank line on the screen, perhaps between one question and response and the next question. In that case, type PRINT [ ] and press return.

SENTENCE: This command tells the computer to put lists of words together. If you type

```
PRINT SENTENCE [TURTLES ARE FUN,] [RABBITS ARE HARE-Y]
```

the computer will put those two lists together and print

```
TURTLES ARE FUN, RABBITS ARE HARE-Y.
```

Now let's put the SENTENCE and PRINT commands together to make the computer carry on an "intelligent conversation." First we'll write a procedure that makes the question WHAT IS YOUR NAME? appear on the screen. Then it will combine an input with a preprogrammed response, in this case,

```
I DON'T BELIEVE WE'VE MET, Name.
```

APPLE:

```
TO TALK
PRINT [WHAT'S YOUR NAME?]
PRINT SENTENCE [I DON'T
BELIEVE WE'VE MET,]
READLIST
END
```

READLIST is used to make the procedure wait for you to type an answer to a question and press return.

MIT:

```
TO TALK
PRINT [WHAT'S YOUR NAME?]
PRINT SENTENCE [I DON'T BELIEVE
WE'VE MET,] REQUEST
END
```

REQUEST is used to make the procedure wait for you to type an answer to a question and press return.

Have your students think up some other short procedures that will ask a question and then combine the answer with a response they make up. For now, do not use yes-no questions. We'll get to them in a minute. A few ideas to get them started:

What's your favorite color?
Who's your best friend?

This article was adapted from The Turtle's Sourcebook *by Donna Bearden, Jim Muller and Kathleen Martin, Reston Publishing Company, Reston, VA. For more information on the book and other Logo activities on or off the computer, contact the YPLA, 1208 Hillside Drive, Richardson, TX 75081. We'd love to hear from you.*

What's your favorite sport?
What kind of music do you like?

It is possible to set up a conditional in a list program. IF you write a procedure that asks a yes-no question THEN you will have to set up a conditional. Since there are two possible answers, you'll want two possible responses for the computer to make. In this case, we'll ask, "Have you ever talked to a computer before?"

APPLE:

```
TO TALK
PRINT [HAVE YOU EVER TALKED]
PRINT [TO A COMPUTER BEFORE?]
TEST READLIST = [NO]
IFT [PRINT [OH BOY! A BEGINNER!]]
IFF [PRINT [DON'T WORRY, I WON'T
TELL ANYONE.]]
```

MIT:

```
TO TALK
PRINT [HAVE YOU EVER TALKED]
PRINT [TO A COMPUTER BEFORE?]
TEST REQUEST = [NO]
IFT PRINT [OH BOY! A BEGINNER!]
IFF PRINT [DON'T WORRY, I
WON'T TELL ANYONE.]
```

To set up a conditional, we use a TEST command and IFTRUE (IFT) and IFFALSE (IFF) commands. IF it is TRUE that the user answers no, the computer will respond with, "Oh boy! A beginner!" IF it is FALSE that the user answers no (in other words, says yes), the computer will print, "Don't worry, I won't tell anyone." Notice how the double brackets are used in Apple Logo.

Have the students write a conversational procedure using all the listing commands they have learned so far. Have them try them out on each other.

Suppose you want to set up a procedure with a variety of choices. We'll combine some turtle graphics and listing for this one and write a procedure that allows students to choose a big, medium or small circle. So first we need to ask which size circle they want to see:

```
TO CIRCLE
PRINT [DO YOU WANT A BIG, MEDIUM,
OR SMALL CIRCLE?]
```

Now we need to set up a conditional that will allow for three different choices: if the answer is big, the turtle must draw a big circle; if the answer is medium, a medium circle; and if the answer is small, a small circle. (This is an excellent time to remind your students to break the problem down into smaller pieces. Rather than combining everything in one procedure,

Circle 332 on Reader Service card.

Why Your Apple Needs DAVID-DOS™

Your Apple is easier to use and runs much faster with this new, licensed by Apple, DOS 3.3 update.

DAVID-DOS (rhymes with moss), is rated AA, (top of its class), by the highly respected software review magazine PEELINGS II.

Novices and Pros

DAVID-DOS is licensed by programmers for inclusion in the software they sell. 30 out of 60 bought it on the spot when DAVID-DOS was demonstrated at the Original Apple Corps, UCLA. DAVID-DOS receives applause from Apple novices. That's why you need DAVID-DOS.

What's Going On

Every Apple II/IIe boots up with DOS 3.3 software.* DOS 3.3 is right there on the first three tracks of all your program disks. Your Apple is supervised constantly by DOS 3.3.

Easier and 5 Times Faster

Our Installation Program goes in and makes specific permanant improvements to DOS 3.3 on all your disks in a few seconds. (The programs on your disks are not touched). From then on your programs load up to 5 times faster. And you have new features that make your Apple easier to use.

*Exceptions are Pascal & CPM Operating Systems.

Apple II and Applesoft are trademarks of Apple Computer inc.

100 Sectors in 7 Seconds

Speed Load Applesoft, Integer & Binary 100 sector programs in 7 seconds. Tload Random and Sequential Text Files at the same speed with a simple command.

Automatic Card Support

Automatically supports an Integer or Applesoft Rom Card in Any slot (without configuring). Single key stroke Catalog and Catalog Abort. Shows Free Sectors Left on each Catalog.

Nine New DOS Commands

1. TLOAD speeds loads all Text Files.
2. TLIST lists all Random/Sequential Text Files.
3. DUMP Binary/Ascii to screen or printer.
4. DISA dissembles Binary to screen/printer.
5. AL prints program Address & Length.
6. / Single keystroke, second Catalog command.
7. HIDOS moves DOS to the Language Card.
8. FIND hex group in 64K memory in 3 seconds.
9. DATE prints out. Use with Mtn. clock card. Commands 8 & 9 in Hidos only.

10K More Memory

These nine commands operate identical to existing DOS commands. Use A or A$ for address and L or L$ for length. Enter new commands on the Keyboard and use them in Basic programs with the familiar D$. Use HIDOS in Hello program for turnkey startup, adding 10K free memory.

Variable Speed Scrolling

TLIST, DUMP, and DISA Features are:

1. Print with PR#.
2. Key operated variable speed control.
3. Instant pause with Space Bar.
4. Exit anytime with Return Key.

Compatible

All DOS entry addresses have been preserved. DOS is Same length and compatible with most software. David-Dos is copyable and creates fully copyable updated disks. Init areas were used for David-Dos. Works with all Apple IIs including IIe 80 Col. Requires 48K. Complete documentation for screen or printing and many utilities are on the disk.

California residents add 6½% sales tax. **$39.95** Foreign add $2.00.

DAVID DATA™

To Order: Send Check To
12021 WILSHIRE BLVD., SUITE 212G
LOS ANGELES, CA 90025 (213) 478-7865

"You say you've got this kid who's going to try to outfox the computer—there's at least one in every class."

write "sub-procedures" for BIGCIRCLE, MEDIUMCIRCLE and SMALLCIRCLE.)

```
TO BIGCIRCLE
REPEAT 360[FD 1 RT 1]
END
TO MEDIUMCIRCLE
REPEAT 180[FD 1 RT 2]
END
TO SMALLCIRCLE
REPEAT 90[FD 1 RT 4]
END
```

READWORD: This command is already defined in the STARTUP procedures in Apple Logo. Here it is defined in both Apple Logo and MIT Logo.

APPLE:

```
TO READWORD
OUTPUT FIRST READLIST
END
```

MIT:

```
TO READWORD
OUTPUT FIRST REQUEST
END
```

```
TO CIRCLE
PRINT [DO YOU WANT A BIG, MEDIUM, OR SMALL CIRCLE?]
MAKE "ANSWER READWORD
IF :ANSWER = "BIG [BIGCIRCLE]
IF :ANSWER = "MEDIUM [MEDIUMCIRCLE]
IF :ANSWER = "SMALL [SMALLCIRCLE]
END
```

MAKE: This command requires two entries. You want to make one entry into another. In essence, you want to MAKE a variable take on the value of the second entry, or second input. For example, MAKE "ANSWER READWORD means that ANSWER should take on the value of the entry made at READWORD.

You say you've got this kid who's going to try to outfox the computer and type in GIGANTIC—there's at least one in every class! You can do one of two things. You can add lines to try to match any of the answers that a smart kid will come up with. For example:

```
IF :ANSWER = "GIGANTIC [BIGCIRCLE]
IF :ANSWER = "HUMONGOUS [BIG CIRCLE]
IF :ANSWER = "SO-SO [MEDIUMCIRCLE]
IF :ANSWER = "TEENSY [SMALLCIRCLE]
```

We could be here all day thinking up possible responses. But why not just add another line to cover all of them? If the answer doesn't match any of the choices, the computer will go down to the next line and respond, I CAN'T DO THAT!

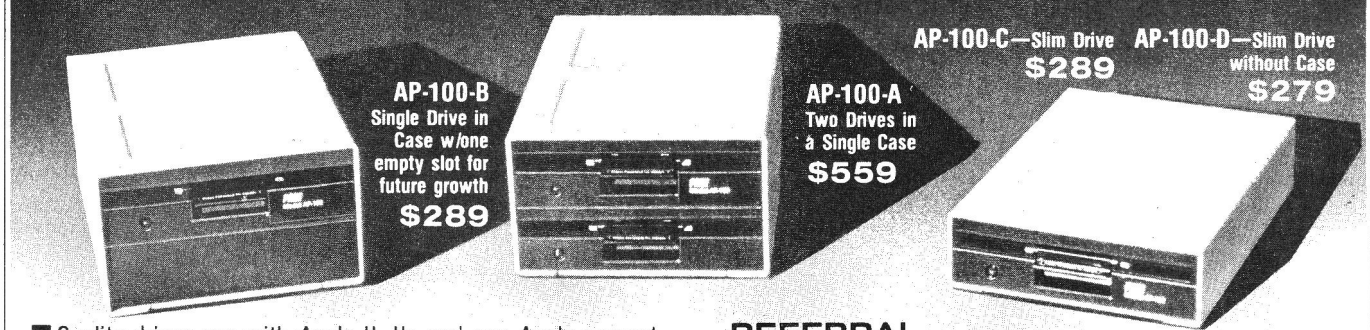

```
TO CIRCLE
PRINT [DO YOU WANT A BIG, MEDIUM, OR SMALL CIRCLE?]
MAKE "ANSWER READWORD
IF :ANSWER = "BIG [BIGCIRCLE]
IF :ANSWER = "MEDIUM [MEDIUMCIRCLE]
IF :ANSWER = "SMALL [SMALLCIRCLE]

INTRODUCING

PACE AP-100 DRIVES for your APPLE II, IIe

- Quality drives run with Apple II, IIe and any Apple compatible computers.
- Superior circuit design using only top quality parts—unlike any of the cut-rate disk drives.
- Advanced steel band head carriage design.
- High speed access time.
- Automatic disk eject.
- Long life ceramic head.

SATISFACTION GUARANTEED
If not satisfied, return in undamaged condition within 14 days for a full refund.

90 DAY WARRANTY

REFERRAL BONUS PLAN
Limited Time Offer

After you purchase a PACE disk drive from us and thoroughly test it yourself, we would like you to spread the word as to its quality and high reliability. When your friends or business associates purchase a drive from us based upon your recommendation, we will pay you a cash bonus of up to $30 per drive. Please call or write for details.

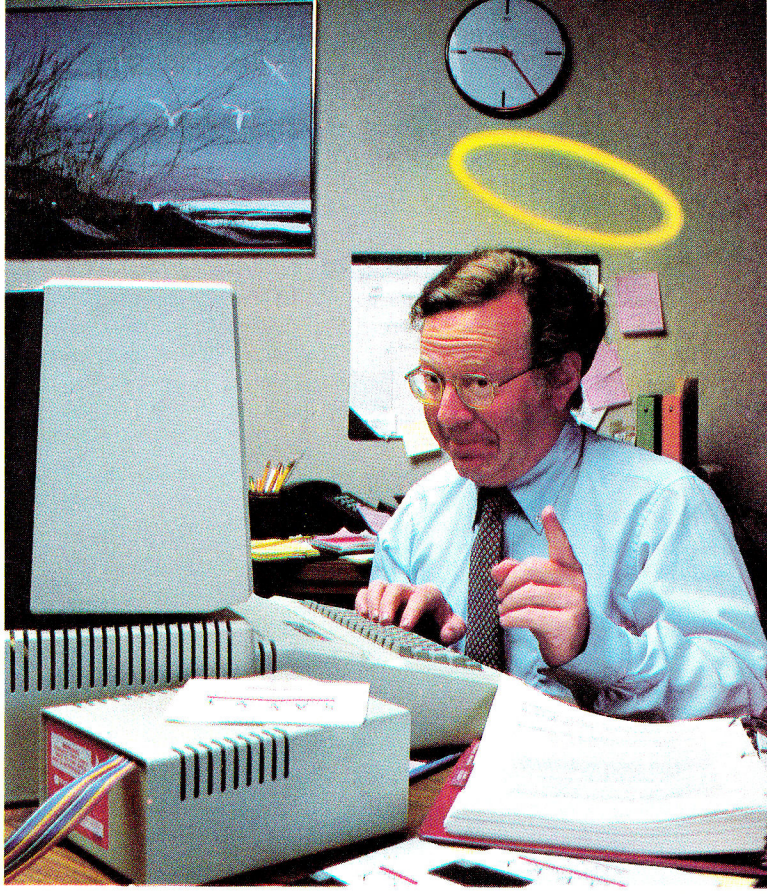

TO ORDER or for FREE LITERATURE, Call TOLL-FREE (800) 323-3543
In Illinois, Alaska, Hawaii, call 312-355-9722

We accept check, money order, VISA or Mastercard (include number and expiration date). Please include $3.50 for shipping, handling and insurance in continental U.S. Illinois residents add 5.25% sales tax. Personal and company checks allow 2 weeks to clear. We do not charge your credit card until the day we ship. Prices subject to change without notice.

PACE SYSTEMS, INC.

To err is human. To forgive is SAVVY.™

With SAVVY™ you can misspell, mistype or rephrase and still command your computer.

If you're tired of inflexible personal software, it's time to get SAVVY.

SAVVY teaches your computer to adapt to you. It's part hardware, part software, and part remarkable. It lets your computer see things as you see them. Do things the way you like to do them. It even allows for those unavoidable entry errors that we all sometimes make.

What's the secret? SAVVY can recognize patterns (other software products can only recognize exact duplicates) and you can teach it to recognize your language. That means it will carry out your commands instead of flashing "error" messages.

Whether you want SAVVY to teach yourself programming, to run your business applications or to develop drills for students, there's a version of SAVVY to suit your needs and your budget. It's a database system, file manager, natural language programmer, and an operating system, all in one. SAVVY operates on Apple II Plus® and IIe® computers as well as Apple-compatibles.

Call 800-551-5199 to arrange for a demonstration at your local dealer.

SAVVY is a product of Excalibur Technologies Corporation, 800 Rio Grande Boulevard N.W., Mercado 21, Albuquerque, New Mexico 87104.

SAVVY™

Circle 126 on Reader Service card.

"Sometimes, when you look at Logo commands, they seem to make no sense at all. But look again."

and then draw a circle according to the choice made suggests the possibility of writing a procedure to have the turtle draw any geometric shape the user wants. Since this is a conversational program, begin by asking the user if she or he wants to see some shapes.

TEST FIRST READWORD = "Y

Sometimes, when you look at Logo commands, they seem to make no sense at all. But look again. You know what TEST means—you want to TEST to see if something is TRUE or FALSE. READWORD means to read the word entered in response to a question.

Now! What would TEST FIRST READWORD = "Y mean?

If you said, TEST the FIRST element of the entered response to see if it begins with Y, give yourself a gold star. You're absolutely right. When FIRST is included in a command, it means to look at the first element of a word or list. In this case it means TEST the FIRST element of the entered response to see if it begins with Y. The entered response could be YES, YEAH, or just Y. The action to follow would be the same.

Not to confuse the issue of our procedure; but now that you have an idea of what FIRST does, consider what would happen if the same line read, TEST LAST READWORD = "S. What would that mean?

If you said it means TEST the LAST element of the entered response to see if it is an S, you deserve another gold star. The procedure tests the response to see if you entered YES or some other word ending in S.

Obviously, for this procedure, FIRST is the more appropriate command in that it suits a broader range of possible responses to the question. However, there are occasions when you want to test the last element of a word or a list. Why not try a few experiments to see how it can work?

VANISH is an all-purpose type of procedure written here to clear the screen at appropriate times during the procedure.

```
TO VANISH
CLEARTEXT
TEXTSCREEN
END
```

Now let's get back to the "making shapes" procedure.

APPLE:

```
TO SHAPES
VANISH
PRINT [WANT TO SEE SOME SHAPES?]
TEST FIRST READWORD = "Y
IFT [PRINT [], PRINT [WHAT
SHAPE DO YOU WANT TO SEE?]]
IFF [PRINT [], PRINT [OK, BYE
FOR NOW!] STOP]
PICK
END
```

MIT:

```
TO SHAPES
VANISH
PRINT [WANT TO SEE SOME
SHAPES?]
TEST FIRST READ WORD = "Y
IFT PRINT [WHAT SHAPE DO YOU
WANT TO SEE?]
IFF PRINT [OK. BYE FOR NOW!]
STOP
PICK
END
```

PICK is a procedure defined to tell the turtle what shape to draw.

APPLE:

```
TO PICK
MAKE "S READWORD
IF :S = "CIRCLE [CIRCLE ]
IF :S = "RECTANGLE [RECTANGLE]
PRINT [
PRINT [I DON'T KNOW HOW TO
DO THAT!]
PRINT [WILL YOU TEACH ME HOW?]
TEST FIRST READWORD = "Y
IFT [TEACH :S ]
IFF [SHAPES ]
END
```

MIT:

```
TO PICK
MAKE "S READWORD
IF "S = "CIRCLE CIRCLE
IF "S = "RECTANGLE RECTANGLE
PRINT [],
PRINT [I DON'T KNOW HOW TO DO
THAT!]
PRINT [WILL YOU TEACH ME HOW?]
TEST FIRST READWORD = "Y
IFT TEACH :S
IFF SHAPES
```

SAYBROOK™ The third alternative for Apple II users

An increasing number of Apple II users have reached the limits of their machines' capabilities. These users face a dilemma: to upgrade to a new computer system or not to upgrade.

That, is no longer the question.
Saybrook offers the third alternative.

Saybrook is the 68000 32/16 bit co-processor for the Apple II. Once inserted, Saybrook transforms the modest Apple into an awesome micro-mainframe computer, capable of 10-20 times the speed of the Apple, with twice the memory on-board!

By drawing upon state-of-the-art technology, Saybrook brings the Apple II user a new dimension of power as yet unknown. No other machine matches Saybrook's awesome power.

ADVANTAGES

- **Speed.** Saybrook's MC68000 32/16 bit processor (identical to Apple's Lisa) runs programs ten to twenty times faster than the Apple II.
- **Memory.** Saybrook gives you 128K RAM on-board—expandable to 512K *on-board.* Saybrook is capable of further memory expansion.
- **Software.** Saybrook will run all Apple BASIC, FORTRAN, and Pascal programs—*ten to twenty times faster.* No other co-processor can achieve this feat. In addition, Saybrook accesses the enormous USCD p-System library of software, as well as CP/M-68K.
- **Cost.** $1,550 suggested retail price, includes the Saybrook 68000 co-processor with 128K RAM on-board; the UCSD p-System (Version IV) with Pascal, FORTRAN-77, and BASIC *compilers.* In addition, Applesoft-compatible, 68000 BASIC is included. CP/M 68K optional. UNIX available soon.

Saybrook is a trademark of Analytical Engines, Inc. **Apple II** is a registered trademark of Apple Computer, Inc. **Lisa** is a trademark of Apple Computer, Inc. **UCSD p-System** is a trademark of The Regents Of The University of California. **CP/M-68K** is a registered trademark of Digital Research. **UNIX** is a trademark of Bell Laboratories.

Circle 337 on Reader Service card.

"The Logo turtle loves to draw and can be quite a conversationalist when challenged."

END

TEACH was defined to get the user to respond with the number of sides the particular shape has and how long to make each side.

```
APPLE:
   TO TEACH :S
   VANISH
   PRINT SENTENCE [HOW MANY
   SIDES DOES A] :S
   PRINT [HAVE?]
   MAKE "R READWORD
   PRINT [],
   PRINT [HOW LONG SHOULD
   ONE SIDE BE?]
   MAKE "D READWORD
   PRINT [],
   PRINT [LET ME SEE IF I CAN
   DRAW ONE NOW.]
   WAIT 80
  .POLY :R :D
   END
```

MIT: (there is no WAIT command in MIT Logo and we must define one)

```
   TO WAIT :T
   HT
   REPEAT :T [REPEAT 4 [RT 90]]
   ST
   TO TEACH :S
   VANISH
   PRINT SENTENCE [HOW MANY SIDES
   DOES A ] :S
   PRINT [HAVE?]
   MAKE "R READWORD
   PRINT []
   PRINT [HOW LONG SHOULD ONE SIDE
   BE?]
   MAKE "D READWORD
   PRINT []
   PRINT [LET ME SEE IF I CAN DRAW
   ONE  NOW.]
   WAIT 10
   POLY :R :D
   END
```

Using the Rule of 360, we can define a polygon procedure:

```
TO POLY :R :D
REPEAT :R [FD :D RT 360 / :R]
END
```

But what about a rectangle? Another procedure will have to be defined in case someone wants to see a rectangle.

```
TO RECTANGLE
PRINT [HOW LONG SHOULD THE LONG
SIDE BE?]
PRINT []
MAKE "LONGSIDE READWORD
PRINT [HOW LONG SHOULD THE SHORT
SIDE BE?]
MAKE "SHORTSIDE READWORD
CS
REPEAT 2 [FD :SHORTSIDE RT 90 FD
:LONGSIDE RT 90]
END
```

To make the whole program repetitive and more conversational, go back to POLY, RECTANGLE, SMALLCIRCLE, MEDIUMCIRCLE and BIGCIRCLE, and add VANISH as the first command. The last three commands in each of these procedures should be:

```
APPLE:
   PRINT [HOW'S THAT?]
   WAIT 180
   SHAPES
   END
MIT:
   PRINT [HOW'S THAT?]
   WAIT 20
   SHAPES
   END
```

Now change the last command in the CIRCLE procedure to SHAPES. This will cause the procedure to keep repeating itself until stopped.

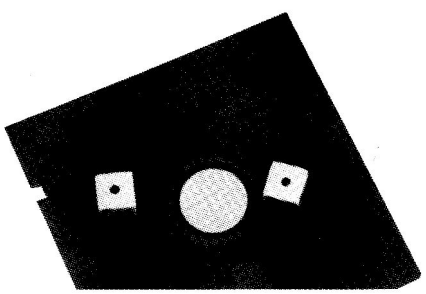

This barely scratches the surface of what can be done with Logo. The graphics are certainly spectacular. But along the way, the learning experience can be greatly enhanced by adding list processing. Word games, word processing and a wide range of other applications procedures then come to life. The Logo turtle loves to draw, and can be quite a conversationalist when challenged.

Arthur Godfrey had a well-known record from some years ago entitled, "What is a Boy?" Among the descriptions was, "The hope of the future with a frog in his pocket." Thanks to Logo and the structured, creative thinking exercises the language offers, boys and girls are fast becoming:

"The hope of the future, riding on the back of a turtle."■

YOU CAN MAKE A FORTUNE IN MICROS!

THE MICRO COMPUTER BUSINESS WILL GROW FROM $10 TO $100 BILLION IN THE NEXT EIGHT YEARS! ARE YOU READY TO CASH IN?

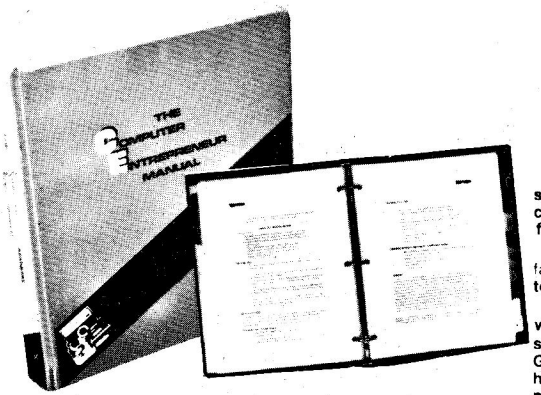

The **micro computer business** is predicted to grow from its present $10 billion to **$100 billion** before 1990! Imagine the possibilities this opens for you! No matter where you live, if you're starting up or presently in business, **no other industry offers you more opportunities!**

Now, finally, all the inside information you need to secure a prosperous future in this dynamic industry is available in **one place - THE COMPUTER ENTREPRENEUR MANUAL!** – An **immense** information source, compiled by our **inquisitive** research team, aided by a panel of **experts** and **business people** from **all areas** of the **computer industry!**

We present the inside story of **more than 100 lucrative computer businesses you can enter,** where you'll find the **real opportunities** for the eighties: from one man operations like **Programming Author, Word Processing Center** or **Consulting,** to **Systems House, Service Bureau, Computer Store etc!** Many at little or no investment! All the invaluable facts and figures: **How to start, Capital needs, Profit estimates and Margins, How to Sell and Market, How missing** technical or business experience **need not stand in your way, Source of Suppliers, etc!** Details that could take **years** to find out on your own!

We'll show you **inside tricks,** like how to **never again pay retail** for computer products and consumer electronics, **even for one item - right now,** while you're starting your business! How to get **free merchandise** and trade show **invitations, etc. This alone** will **more than pay** for the **manual!** You'll read **actual case histories** of other computer entrepreneurs, so you can **learn** from **their mistakes,** and **profit** from their **success stories! Where** you'll be **one year** from now depends on **your actions today!** Let us **show you how** to take the **first crucial steps!**

Order now and take **advantage** of our **limited introduction special, THE COMPUTER ENTREPRENEUR MANUAL,** and a **six month subscription to THE COMPUTER ENTREPRENEUR REPORT/NEWSLETTER** (so you're **always up-to-date** with the industry), **both** for **only $29.95! You must** be **convinced** on **how easy** you can **strike it rich** in the micro computer business - or you may **return** the manual for **a full refund** within thirty days! **USE OUR TOLL FREE NUMBER TO ORDER!**

EVERYTHING YOU NEED TO KNOW TO SUCCEED IN THE COMPUTER BUSINESS IS ALL IN THIS MANUAL!

THE COMPUTER ENTREPRENEUR MANUAL has the **answers** to **all your questions** about **selecting, starting** and **succesfully running a computer business!** There has **never** been such a **comprehensive collection** of **know-how** and **information** about this business **in one place! All the facts you need** to **plan** and **acheive your goals** in **easy-to-follow, step-by-step instructions!**

These are some of the **100-plus businesses** covered in **PART ONE** of the manual, with the facts on **How to start and run, Start-up Cost (Even** how to operate **on a shoestring),** What **profits to expect, Wholesale prices, Mark-ups, Suppliers, future outlook, case histories** for **each, etc:**

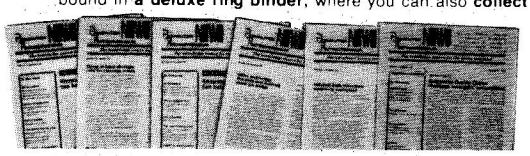

Systems House, Software Author (who to sell to and who to avoid), **Service Bureau, Software Publisher** (How to find programs that sell, **Word Processing Service, Consulting** and **Consultant Broker** (use your skills or those of others, **make $150 - $1000 a day!), The incredible Games Business, Computer Store** (Franchises: Pro and Contra, or a low inventory store **in your home!), OEM, Hardware Mfg, Data base** and **Teletext Service (big prospects!), Used Computers, Repairs, Rent-A-Computer, Promote Fests** and **Trade Shows, Turnkey Systems, Bartering, Mail Order, Compile and rent mailing lists, Specialized Data Headhunting** and **Temp Help Service, Tech Writer Shop, Custom Engineering,** The **highly profitable Seminars** and **Training Business, and many more!**

Many **new ideas** and **ground floor opportunities! Interviews** and **success stories** on **companies** of **all sizes! Privy info on the profits made:** How some **computer store** operators **net** $100 - $250,000! Little known outfits that made their owners **millionaires,** one of these low-key companies, making simple boards, went from **nil to** $20,000,000 and **100 employees** in **four years!** Programmers that make **$300,000, Thousands** of **micro millionaires** in the making, etc!

Whatever your goal is - **Silicon Valley Tycoon,** or just a **business at home - we guarantee** you'll find a **business** to **suit you - or your money back!**

PART TWO of the manual is **loaded** with the **know-how** and **"streetfighting" savvy** you need, both as a **novice** or business **veteran,** to get started, to stay and to **prosper** in the micro computer business! **A goldmine of information** in clear and easy-to-use instructions: How to prepare your **Business Plan, Outside financing,** The **mistakes** you **must avoid,** How to **hire** and **manage employees, Incorporation** (when, and how to do it **cheaply), Surviving bad times, Record Keeping,** how to **estimate your market before you start,** Use **multiple locations** to **maximize profits,** how to **promote** and **stay** steps **ahead of the competition!** How to get **free advertising, free merchandise, free advice, Power negotiating** with suppliers to **double** your **profit margins, etc!** Even how to **keep a present job while starting a business part time!**

Don't miss this opportunity to be part of this **great industry - the next success story** could be **your own! Order the manual today!** Part one and two, bound in **a deluxe ring binder,** where you can also **collect our newsletter (free for six months with the manual - a $32.50 value!) - all for only $29.95!**

THE COMPUTER ENTREPRENEUR NEWSLETTER – ALL THE LATEST INSIDE BUSINESS NEWS! NOW! SIX MONTHS FREE WITH YOUR MANUAL!

You're **always attuned** to the industry, and **your manual kept up-to-date,** with our **newsletter!** Each issue has the **latest business news, ideas, new suppliers,** our **indispensible "watchdog" column** on **profits, discounts** (don't miss mfg's promos, like recently, when top video monitor sold at $80 - that's half wholesale, **one third of the retail price!), the competition, the big deals, etc!** Feature stories with start-up info and case histories **on new micro businesses!**

You'll get **invitations** to trade shows and conventions, the **usage** of our **advisory service** and our **discount buying service** for your purchases!

You'll find **many items** in our newsletter that will **save you the cost of your manual many times over!**

SuperPILOT

Fasten your seat belts! Get ready for SuperPILOT, Apple's new CAI authoring language that leaves menu-driven authoring systems in the hangar.

by Stephen M. Weissmann

Okay, you've got the Apple computer in your classroom—what do you do with it? Did anyone remember to order software? If so, is it written in language too sophisticated for your second grade class? Are your students already bored with the programs you own? Perhaps you have just found an ad for the perfect program for your class, but the budget is exhausted or non-existent? Or maybe you would like the computer to review terms and concepts different from the ones on the disk you own?

Do any of these situations sound familiar? Why not create your own interactive lessons, especially designed for your curriculum and your students? You have two major options to choose from: authoring systems and an authoring language.

There are over a dozen software packages on the market designed to help educators produce their own CAI (computer aided instruction) materials. Most of them provide for presenting text on the screen, then collecting and evaluating the student's response. These authoring systems are usually menu driven and demand no special programming skills on the part of the instructor. While these systems do allow the instructor to write his or her own material, they are often severely limited by the range of formats in which information can be presented and tested.

Apple Computer Company has chosen to take a different route. SuperPILOT is an authoring language. Rather than just an outline for multiple choice tests and matching exercises (which it does provide in the Shell Games), SuperPILOT is a complete programming language.

While it is not as rich and complex a language as Basic or Logo, SuperPILOT is ideally suited for one purpose: the development of interactive tutorials for your classroom. In addition to the PILOT language, Apple's package provides an environment for creating color graphics, keeping student records, adding sound effects, and much more.

The SuperPILOT Package

SuperPILOT comes with an author disk (and backup) which contains the language and the editors; a disk of sample lessons, special characters, and sound effects; a two-disk tutorial; and two manuals. At $200, it is comparable in price to many of the authoring systems available. With the simplicity and flexibility of the PILOT language and the many built-in abilities of SuperPILOT editors, it represents quite a value.

System Requirements

SuperPILOT is designed for the Apple II with 64K of memory. According to Apple Customer Relations, although not according to Apple dealers' information, it is compatible with the Apple IIe. I have found it to be almost completely compatible with Apple's earlier software package, Apple-PILOT, when used on the Apple II.

In order to develop a lesson, two disk drives are required. However, when the student is running the lesson, only one drive is necessary.

If the cost of the package appears high, the cost of using SuperPILOT in the classroom is minimal once the lessons are developed. The entire PILOT language is written onto each student's lesson disk, which can be copied. Thus, investment in SuperPILOT involves a one-time cost of $200, blank disks and the time involved in writing the lessons. Additional options include a statistical package to analyze records of student performance (Apple SuperPILOT LOG, $50) and firmware cards to interface between SuperPILOT and other devices such as videotape and disk.

"But," you are saying, "I can't program. I don't even know Basic!" Then read on. SuperPILOT is written just for you.

Address correspondence to Dr. Stephen M. Weissmann, Associate Professor of Psychology, Plymouth State College, Plymouth, NH 03264.

Lee McFadden makes learning to use your computer and its programs an easy, rewarding experience.

Mastering a new system or even a new program is not easy. It takes a lot of study, a lot of trial and error, a lot of back-and-forth between dense manuals and your computer. Wouldn't it all be so much easier if you had a knowledgeable friend sitting by your side?

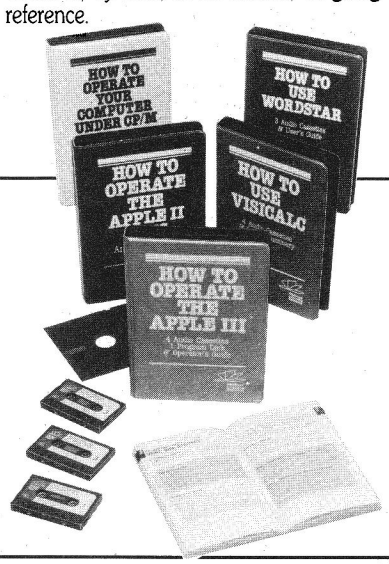

Lee McFadden is that friend. He's been producing widely acclaimed teaching tapes for over ten years. He knows what information you need, and exactly when you need it. Team his skill with the know-how of technical experts, and you get a faster, easier way to master your computer and all its power.

Patented Audio Cassettes

Lee guides you patiently, step-by-step, while you're sitting at your keyboard. No connection between the computer and your cassette player is necessary. You learn by *doing*, instead of by reading. And even the tapes are special—a patented FlipTrack system lets you go at your own pace, covering as much or as little detail as you want.

Ideal for Training

Use the courses over and over again. Share them with friends, family, students and staff. Make "computer literacy" a reality in your local schools. Bring a new employee "up to speed" in just hours, instead of weeks. The fully indexed Guide included with each course is, by itself, an invaluable, on-going reference.

Moneyback Guarantee

You may order any of the FlipTrack courses from us on a 15-day "right of return" basis. Try a lesson or two yourself. Share them with others. If you're not delighted at how quickly and easily you begin to learn, simply return the program in its original condition for a full refund. No questions asked.

How to Order

Drop by your local dealer for a demonstration. Or Visa and MasterCard holders may add $2.50 shipping and handling to the prices, and order toll-free:

1-800-227-1617, Ext. 439

(In California, call 1-800-772-3545, Ext. 439.)

Choose from these rewarding courses:

How to Operate the Apple II® (specify "e" or "Plus")
3 audio cassettes & Operator's Guide $49.95

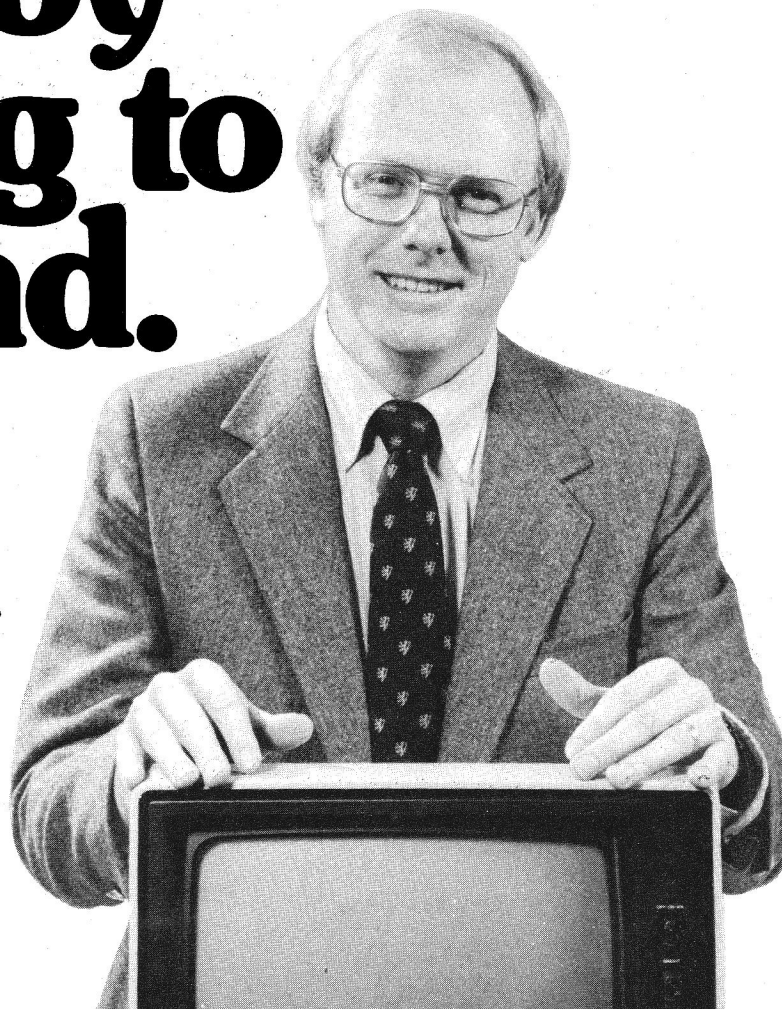

How to Operate the Apple///®
4 audio cassettes, 1 diskette & Operator's Guide.. $95.00

How to Operate Your Computer Under CP/M®
3 audio cassettes & Operator's Guide $49.95

How to Use VisiCalc®
4 audio cassettes & Lesson Summary $65.00

How to Use WordStar®
3 audio cassettes & User's Guide $49.95

Learn by listening to a friend.

Circle 46 on Reader Service card.

Developing a Tutorial

SuperPILOT has only 26 commands, each consisting of one or two letters; only half a dozen are used regularly. For the most part, you spend your time typing the contents of your lesson and not a lot of program code.

All instructions in SuperPILOT consist of three parts: an operation to be performed (symbolized by one or two letters), a colon and an "object" of the operation. For example, the statement:

```
T: What is the capital of New Hampshire?
```

will result in the phrase What is the capital of New Hampshire? appearing on the screen. The type, T:, command simply displays everything written after the colon and is probably the most frequently used command in SuperPILOT.

To get the student's answer at this point, the next instruction would be:

```
A:
```

That's it—no special symbols, no variable names. The accept, A:, operator tells the computer to take whatever is typed next on the keyboard and store it as the current answer. Until SuperPILOT encounters another A:, the student's response is available for evaluation. Responses can be labeled and stored more permanently, but we'll get to that later.

The function of the match, M:, instruction is to decide whether the student answered the question correctly. SuperPILOT will search the student's answer for whatever is written after the colon. Thus, the command:

```
M: Concord
```

initiates a search for the letter sequence C-o-n-c-o-r-d in the answer. If it is found, a congratulatory message should appear and the lesson advance to the next question or to new material.

But, how does SuperPILOT know that the answer is correct? It doesn't of course. What it does is make the execution of the next command conditional on the outcome of the matching procedure. Every command in SuperPILOT can be qualified according to criteria that you determine. In this case, did the student type Concord?

The statements:

```
TY: Great!
TN: No, that is not the capital.
```

produce the appropriate feedback. Y and N (called conditioners) refer to the outcome of the matching operation. The student sees Great! only if the match is found. If a match is not found, then the material after TY: is not displayed and SuperPILOT moves on to the response for a wrong answer. The N conditioner allows the instruction to be executed only if the match is not found. The program for this lesson appears in Listing 1.

Branching

Moving to different parts of the program is accomplished with a pair of SuperPILOT instructions. The jump, J: command transfers control to a new part of the program. Unlike Basic, the destination of a jump is not a line number, but a labeled section of the program. For example, the statement:

```
JY: Quest2
```

transfers the lesson to the next question, but only if the student has correctly answered the previous question (remember the Y conditioner). Any set of symbols can serve as a destination label in SuperPILOT, but it is helpful to use some mnemonic scheme to help organize the program. For example, if this were part of a quiz on the capitals of all the states, each section might be labeled with the appropriate two-letter state abbreviation. (Labels do not appear on the screen, when the program is run.)

Error Diagnosis

One of SuperPILOT's nicest features is the ease with which you can diagnose student errors. What if the student has not typed the correct answer to our question? Rather than just say "Wrong," why not find out if the student has substituted the capital of another state. If the match statement:

```
M: Santa Fe!Trenton!Albany
```

were added to the program, it could detect the presence of the capital city of other states with "New" in their name. The ! symbol in the M: instruction enables you to detect the presence of any one of a number of different possibilities in the student's answer.

The statements:

```
TY: That is the capital of a state beginning
  : with 'New', but it is not the capital of New
  : Hampshire .
  :
 T: Let's try that state again.
 J: Quest1
```

now provide some corrective feedback, but only if the student has typed one of those three cities. Note that the Y conditioner applies only to the outcome of the most recent match (the three cities) and should not be confused with the concept of correct. Trenton is obviously a wrong answer, that can be detected and responded to with the appropriate M: and TY: instructions.

The T: and J: commands are left unqualified here, since any answer being evaluated at this point in the program must be wrong. The correct answer would have resulted in the program branching to the part labeled Quest2. The program written thus far is shown in Listing 2. In order for it to actually run in SuperPILOT, it is necessary to supply the labels Quest1 and Quest2. To be recognized as a destination for the J: command, all labels must begin with the * symbol.

Answer Counting

This lesson will continue to ask the student for the capital of New Hampshire until he or she gets it right, or stops trying. The repetitive loop was created with the J: command and a destination label, Quest1 in this case. Using a new conditioner easily allows the instructor to determine how many times this question is asked before providing feedback such as hints or prompts, or even providing the correct answer and moving on to another question.

SuperPILOT provides a built-in answer counter that calculates the number of times an A: command has been executed and can be used to qualify any SuperPILOT instruction. For example, the feedback Great! in our lesson could be reserved for the cor-

```
T: What is the capital of New Hampshire?
A:
M: Concord
TY1: Great!
TN: No, that is not the capital.
```

Listing 1. First SuperPILOT program.

```
* Quest1
T: What is the capital of New Hampshire?
A:
M: Concord
TY: Great!
JY: Quest2
TN: No, that is not the capital.
M: Sante Fe! Trenton! Albany
TY: That is the capital of a state
  :beginning with 'New', but it is
  :not the capital of New Hampshire.
  :

T: Let's try that state again.
J: Quest1
* Quest2
```

Listing 2. Expanded SuperPILOT program.

rect answer on the first try with the statements:

```
TY: That is correct.
TY1: Great!
```

The conditioner 1 allows that T: instruction to be executed only if this is the first time the question has been asked. The statement will be ignored on subsequent queries. The answer counter could also be used to provide hints and prompts after repeated errors. For example, the statement:

```
TN3: Remember, New Hamshire is a state in
  : New England.
```

may help the student to recall the correct answer more effectively than three repetitions of, "No, that is incorrect."

The counter can qualify any SuperPILOT instruction. The statements:

```
TN4: Let's look at a map of New England.
JN4: MapNE
```

would break the chain of asking for the capital of New Hampshire after the fourth incorrect response and move the student to another section of the program. (All counters and answer buffers are reset at the next new A: command.) This feature makes customizing lessons to the needs of your students and the difficulty of the material exceptionally easy.

The program of the complete lesson developed is shown in Listing 3. Note that all the labels used in the J: statements must be present for the program to run without error. Even though the parts of the program labeled Quest2 and MapNE have not yet been written, the labels must exist. This is especially useful when developing a lesson. Individual sections can be planned and labeled, but programmed separately and later inserted at the appropriate point in the lesson.

Special Features

So far we have seen the development of an interactive lesson. The program shown in Listing 3 presents information on the screen, accepts answers from the student, evaluates each answer according to criteria selected by the instructor, and provides special feedback based on the evaluation. It can ask a question again or advance to a new section of the lesson.

But this is only the beginning. SuperPILOT can do so much more. Once the techique of lesson develop-

Apple® Compatible

Printer Interface And Graphics Too!

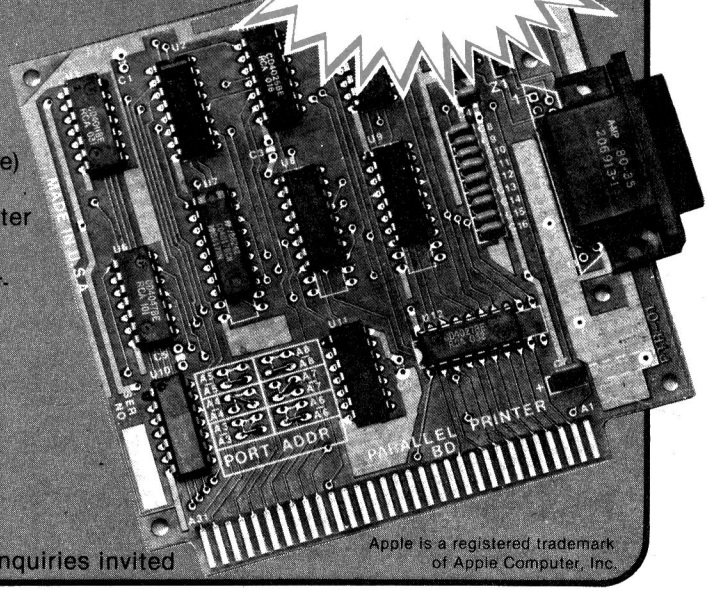

$59.95

For all Apple users who do not need the bells and whistles that you are forced to purchase with those high priced printer interface cards, **Project 1** presents the low cost Centronics type interface card. This unbuffered parallel interface card is designed to work with Epson, Star Micronics, Axiom, Coex or almost any 8-bit parallel printer available.

In addition, for only $9.95, we supply you with a graphics capability for your Epson printer. Some of the graphics features available are:

- Normal and inverse image
- Large or small image size (20% to 70% of page)
- Load programs direct from the disk
- Dump existing programs already in the computer
- Works under Apple DOS 3.3

The interface card comes complete with an FT interconnect cable with Centronics type plug, factory wired for the Epson MX printer family. Ask for it at your local dealer or send check or money order for $59.95 plus $9.95 for the graphics option:
(CA residents add 6.5% for sales tax)

APPLE JUICE

If your Apple or Franklin isn't giving you all the power you need, it's not rotten. It just needs to be juiced up. With a Starfire™ Winchester hard disk drive from Corona.

It leaves Apple DOS in the dust.

For starters, the Starfire gives you all the power inherent in a hard disk drive. Lightning speed (up to 10 times faster than a floppy), enormous storage capacity (5 and 10 megabytes), and superb data reliability.

With none of the bottlenecks, headaches and hassles of floppy drives.

But even better, it makes Apple DOS infinitely friendlier, faster and more powerful.

A lot more slices from the pie.

Our version of Apple DOS is so powerful and friendly, it's like getting a whole new computer. You can work with files up to 400K. Boot into any program from the hard disk. And run programs with a single keystroke.

We've added other features from the Corona PC, our own 16-bit desktop and personal computers. You can automatically, selectively backup your volumes. Partition the disk and run up to 16 different operating systems, including Apple DOS, Pascal and CP/M.[1]

And depend on our DataGuard™ and Fail-Safe™ data protection systems for the disk reliability and data integrity you need.

Your saving grace.

And if you're running programs that use a lot of K's, you're still okay because we don't use any of your main memory.

The Corona Starfire is software-compatible with industry-standard packages like VisiCalc,[2] DBMaster,[3] dBASE II[4] and many others.

So if your Apple is being squeezed, juice it up with the Corona Starfire hard disk.

For the name of your nearest Corona dealer, just call us toll-free at 800-621-6746. Or write Corona Data Systems, 31324 Via Colinas, Westlake Village, CA 91361. (213) 991-1144.

Correction.

It's simple.

New **Spell Perfect**™ from LJK does what your second grade teacher wanted to do. It corrects your spelling. Used with Letter Perfect™, it checks your work against an expandable dictionary. Gives "sounds like" suggestions. Counts words. Add words. Technical terms. States and towns.

You can do it all, all-in-one dictionary.

When it comes to practical software for Ataris, Apples and look alikes, Spell Perfect is simple to learn. And hard to beat. Ask your dealer for a demonstration, or write LJK for more information.

desired frames on demand for correction or review.

Error Handling

An especially nice feature of SuperPILOT is its ability to tolerate most errors it encounters when running a lesson. When running in the author mode, an error message will appear on the screen and the line where the mistake occurred will be printed with the cursor placed on the first erroneous symbol. From the instructor's point of view this is a delightful aid in debugging your program.

Even more delightful is SuperPILOT's ability to recover from programming errors and continue with the lesson, instead of crashing to the Apple monitor, when in the lesson mode. For example, the following statements can detect alphabetic characters when numbers were expected in the answer:

```
T: How old are you?
A: #x
Te: Please type a numeral.
Je: @A
```

The e conditioner prevents the SuperPILOT commands from being executed, unless an error has been encountered. Such is the case here, where letters were found in the response to an A: which expected numbers only. Appropriate correction messages can be displayed and a new answer accepted. (The Je: @A command returns control to the most recent A: command.)

Co-PILOT

A very useful part of the SuperPILOT package is the tutorial provided on two disks. After each major command is presented in a colorful and clever way, the user is encouraged to try out the command. The advantage of this feature is that the commands are immediately executed, something that doesn't happen when creating your own lessons. The immediate feedback is an enormous aid in mastering the fine points of the SuperPILOT language. In addition, the gentle prompts and corrections to your mistakes provide an excellent model of a good tutorial. (Co-PILOT is available as a separate item for $35, Apple product # A2D0050.)

"The gentle prompts and corrections to your mistakes provide an excellent model of a good tutorial."

The Editors

Probably the most confusing aspect of SuperPILOT for the beginner is the environment that is created by the master, or author, disk. Unlike Basic, where commands are typed directly into the Apple computer, SuperPILOT lessons and special effects are created in a series of "editors." These editors are actually files contained on the author disk which is placed in drive 1. The disk that contains the lesson is placed in drive 2. Since the files on the author disk are large, frequent disk access is required to leave room in memory for your lesson program. This is why two drives are necessary in the author mode.

For example, the program of your lesson is written in the lesson editor which you select from the main menu. One way to approach this is as a small screen-oriented word processor. Using different keystrokes (somewhat like the ones in AppleWriter II) the text of the program is written and edited. You can easily insert and delete symbols and whole lines. Whole segments of a program may be copied and moved to another location in the lesson. When you are satisfied with the lesson, or you want to see how it is working, you "quit" the editor and only then is the program written to the disk. Just as with a word processor, it is a good idea to get into the habit of frequently saving the program to disk.

Based on my own personal experience and observing teachers learning how to program, this is the most difficult feature in SuperPILOT to master. The sequence of keys and carriage returns that must occur to leave the editor, save the program to disk, and then get it up again before running it, is not the most obvious or memorable. It is not uncommon for novice programmers in SuperPILOT to lose their first efforts. However, I can assure you that with a little practice, the sequence becomes second nature.

Graphics and special effects are also created in their own special editors. The commands to enter and leave the three special effects editors are the same as in the lesson editor, but otherwise each is a specialized environment that must be individually learned. In my opinion the effort is worth it. Once the techniques are mastered, which only comes with practice, you can easily create lessons enriched with special effects.

Strengths and Weaknesses

The best aspect of Apple's SuperPILOT package is the PILOT language itself. Based on Common PILOT developed at the University of Western Washington, it is ideally suited for creating interactive tutorials in the classroom. With creative use of the match (M:) and compute (C:) commands, student responses can be analyzed, diagnosed and specialized feedback provided. Of course, this can be done with almost any computer language. But it is the built-in features of SuperPILOT that make it so attractive as a language to develop CAI materials. Using a language such as Basic, it is generally recognized that to create an hour of quality computer interaction involves at least 200 hours in development. With SuperPILOT, that figure is closer to 20 hours.

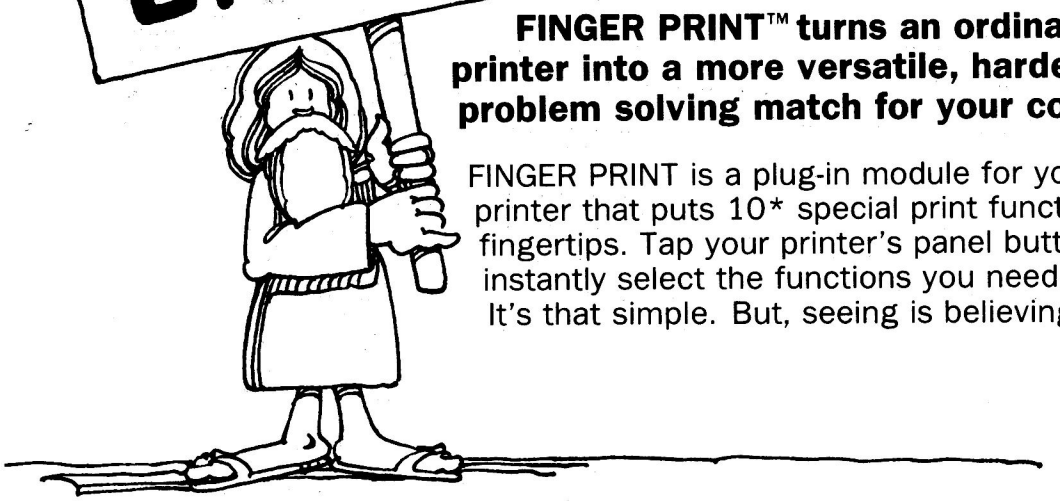

Apple has expanded the language with the ability to create color graphics, to create and use special character sets, and to incorporate sound effects and music into your lessons. While it can be tricky to learn these editors, the extra value that they bring to a lesson is worth the effort.

Finally, Apple has included a two-disk tutorial on the features of the PILOT language. It is excellent. Those of you who were stymied by the manuals of the earlier Apple PILOT will be delighted by these friendly lessons.

Okay, now for the bad news. The problems with the manuals hinted at in the last paragraph have not been solved; if anything they are worse, since there are more features to discuss in SuperPILOT. Let's face it, the

NO MORE LAZY EPSONS!

Now Available for MX & FX/RX Models, too!

FINGER PRINT™ turns an ordinary Epson printer into a more versatile, harder working, problem solving match for your computer!

FINGER PRINT is a plug-in module for your Epson printer that puts 10* special print functions at your fingertips. Tap your printer's panel buttons to instantly select the functions you need. It's that simple. But, seeing is believing...

Want to use compressed to get more columns on your spreadsheet? You got it!
Need a double-wide heading? Easy!
Want to emphasize print on your final draft? No sweat!
Tired of printing on the perforation?

With automatic perforation skipover, it doesn't happen!
Want to use italics to make a paragraph stand out? Simple!
Need Fine Print for a contract or footnotes on a report? With Fingerprint just tap the buttons!
Even combinations like double emphasized italics are no problem!

That's just a sample of how FINGER PRINT turns your Epson MX 80/100 or IBM PC printer into a hard working printer...and FINGER PRINT has Buffer Clear and Left Margin Control, too!

FINGER PRINT will not interfere with normal printer operation...and installs easily, without soldering. It comes with complete operating/installation instructions, control panel reference label, and it's WARRANTED FOR 1 FULL YEAR.

*For Graftrax-Plus equipped printers. Italics and Fine Print cannot be selected on non-Graftrax-Plus models.

$59.95 Look for FINGER PRINT at your local computer dealer. For the name of a dealer near you, or additional information, call (213) 914-5831. To order directly, call toll free: 800-835-2246, Ext. 441. MC/Visa/COD orders accepted (include $1.50 s/h...CA residents add sales tax).

"If a little tedium is the price to pay for those special effects and text editors, then I, for one, am willing to pay it."

SuperPILOT Language Reference Manual is not something you are going to curl up with in front of your woodstove on a cold night. It is precisely what it says it is—a reference. Once you have mastered the commands and the editors, it is an excellent source for advanced procedures, programming tips and guidelines for creating good CAI material. It is filled with excellent examples and clear descriptions of how the commands work. It is well organized into sections determined by the category of the instructions (text, compute, graphics, and so forth). And it is very well indexed. The *Editor's Manual* is similarly valuable when used as a reference.

Part of the problem with the manuals is that they are exceptionally complete. Unfortunately, when you are trying to figure out how to get your message typed on the screen, you are not terribly interested in the modifiers and conditioners or the size and color of the letters. My advice is to work through the tutorial on Co-PILOT first and try some simple programs to get used to the editors. Draw a picture or write a short melody. Then take another look at those manuals. What at first appeared strange and confusing may turn out not to be so bad after all. In fact, after some experience, you may discover, as I have, that those manuals are really a strength of the package and not a weakness at all.

The editors in SuperPILOT, in my opinion, are confusing and unintuitive to the novice. Above all, they are *slow*! Waiting while the lesson editor tells you that it is writing your lesson to the disk and then that it is compacting the disk and then getting back to your lesson to run it to see if that last change finally works is downright frustrating. There is some improvement over Apple's original PILOT. Now you can see the immediate execution of a SuperPILOT command while in the lesson editor or at an accept (A:) when running and debugging. But it still only allows you to see the outcome of a single command.

However, if a little tedium is the price to pay for those special effects and text editors, then I, for one, am more than willing to pay it. SuperPILOT allows me to create interactive tutorials that I don't have time to write in Basic. Furthermore, it lets me create color graphics (I can't draw), play music (I can't sing), and use character sets in languages that I don't even speak.

I do more than write about Apple's SuperPILOT—I use it. Starting in September, I have been granted a sabbatical leave to create a computerized, interactive study guide for my general psychology course. How will I program it? There's no question; I'm using SuperPILOT. ■

Summer Sizzle!

from

AVANT GARDE

Select your own way to heat up summer with one of these sizzling Avant Garde action games!

Start by strapping yourself into this summer's hottest new climber, **JUMP JET**; 20 tons of thrust packed into the world's most advanced aircraft, pitted against cruisers, submarines, fighter planes, anti-aircraft guns, torpedos and sea to air missiles. No doubt about its excitement, but take warning. This may be the trickiest action game you've ever played. (Apple)

Maybe you'd rather take it easy on one of Avant Garde's three **HI-RES COMPUTER GOLF 2 Pro Courses**, all included on one disk. Did we say, "take it easy"? Not a chance! This game's even more exciting than the real thing. The heat you feel won't be because of the summer sun. From the comfort of your air conditioned home you'll face lakes, trees, sand traps and roughs. There's a changing wind factor to consider and you can control your swing or the auto-swing can be used. The greens are even contoured. (Apple)

Or maybe your interests lie in other galaxies. Imagine yourself trapped in a mirror filled **LAZER MAZE**, knowing that an alien opponent is lurking nearby. He's waiting for you to fire your lazer at the wrong mirror, sending its reflected beam zig-zagging harmlessly out of his path, allowing him to fire upon you! Be accurate and be fast in this timed action game. **LAZER MAZE**, adding fuel to the summer fire! (Apple, Atari, IBM PC, VIC 20, Commodore 64)

Perhaps your idea of a hot time includes playing action arcade games? Then give yourself three times the excitement with **TRIPLE ARCADE INSANITY: Alien Onslaught, Galactic Conquerors** and **Andromeda Blitz**. One disk, three separate games. But keep in mind that you'll need up to six direct hits to destroy these pesky starhoppers. (Apple)

When we say summer sizzlers, we're talking hot action. The only question is: can you stand the heat?

Interactive Art

Of all the interesting uses ever found for micros, these certainly rank high. We think there's a lesson to be learned here.

by Stephen Wilson

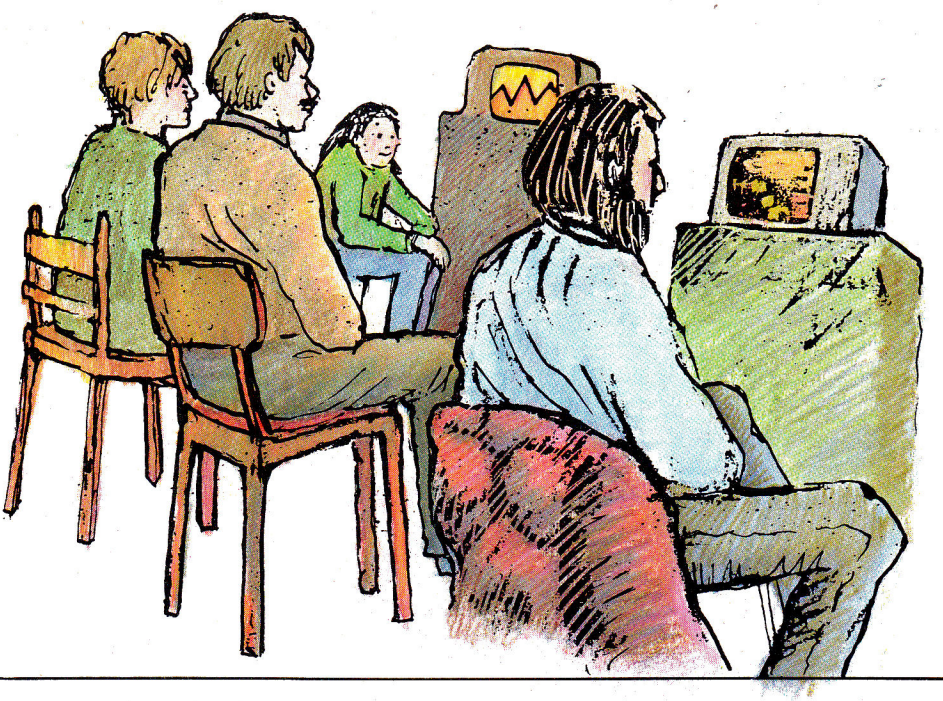

Most new applications for computers continue to speed or expand what was done in other ways before computers; occasionally computers give birth to unique applications. I have developed an innovative art form born out of the unique potentials of computers.

I call it an art form, but it's really an unusual concept that defies classification; it exists in a space somewhere connected to all of the following: conceptual art, performance arts happenings, computer graphics and music, experimental theatre, advertising display, humanistic psychology therapy and computer games. I have been developing it primarily in a visual art context, but my organization—interactive arts—is working on applications in other fields such as theatre, education and advertising. You will no doubt see many other applications.

The general framework of these events consists of individuals or groups of people interacting with sensors and TV monitors hooked up to a central microcomputer. The computer goes through interconnected cycles of giving people choices and then generating text, sound and animated video graphics in response to the choices made. Often these events are structured so that the computer focusses the participants' attention on the individual choice process or the interaction between people in addition to the video and sound generated.

The physical layouts of the events are unusual—for example, a theatre hall with people seated around sculptural objects containing switches or dials, or store windows on a busy street, with touch spots that can be activated from the street. Think of the analogy of a computerized video game, blown up in scale and scope so it involves many people over great distances, specially adapted to particular physical settings, and many-layered in content so that it has goals such as insight and emotional experience in addition to entertainment.

The audience in these events is hardly traditional. The computer creates situations where the audience must be active in making choices and responses, and thus must collaborate

Address correspondence to Stephen Wilson, Conceptual Design Area, Art Department, San Francisco State University, 1600 Holloway Ave., San Francisco, CA 94132.

with each other in creating the events. Society is at a turning point in regard to the social implications of the new computer technologies: Either their applications will accelerate the passivity that is already a tendency of mass culture, or the technologies will enable new realms of active individuality and choice. My work seeks to promote the latter.

In all of the events I used a 48K Apple II Plus with Apple Disk Drive, and the Mountain Hardware 16-channel A/D D/A board. (You can also use the game controller A/D input.) I custom built the interfaces out of parts generally available from electronics stores such as Radio Shack. Thus, for input devices I used switches and 150k pots in "Interactive Computer Theatre," photo cells in "Computerized Street Events" and "Exploring Frames of Mind," and a resistive drawing material and metal pointer in "Memory Map."

Interactive Computer Theatre

As part of the "Live Works" series of performances at the School of Art Institute of Chicago, I created an event called "Interactive Computer Theatre," which 135 people attended. In this event participants were divided into several groups. Each group had indicator devices and video monitors hooked to a microcomputer. Interactions within and between groups affected the flow in real time of a series of video events. The interactions of the groups and the potential for people to have enjoyable or insightful interchanges with strangers were a major focus of the piece.

Group Assignment: An attendant at a computer asked participants as they entered a series of questions about how they typically acted in groups—did they tend to be a team leader, act as a diplomat, stay quiet, etc.? The computer then processed this information and assigned them to one of four groups.

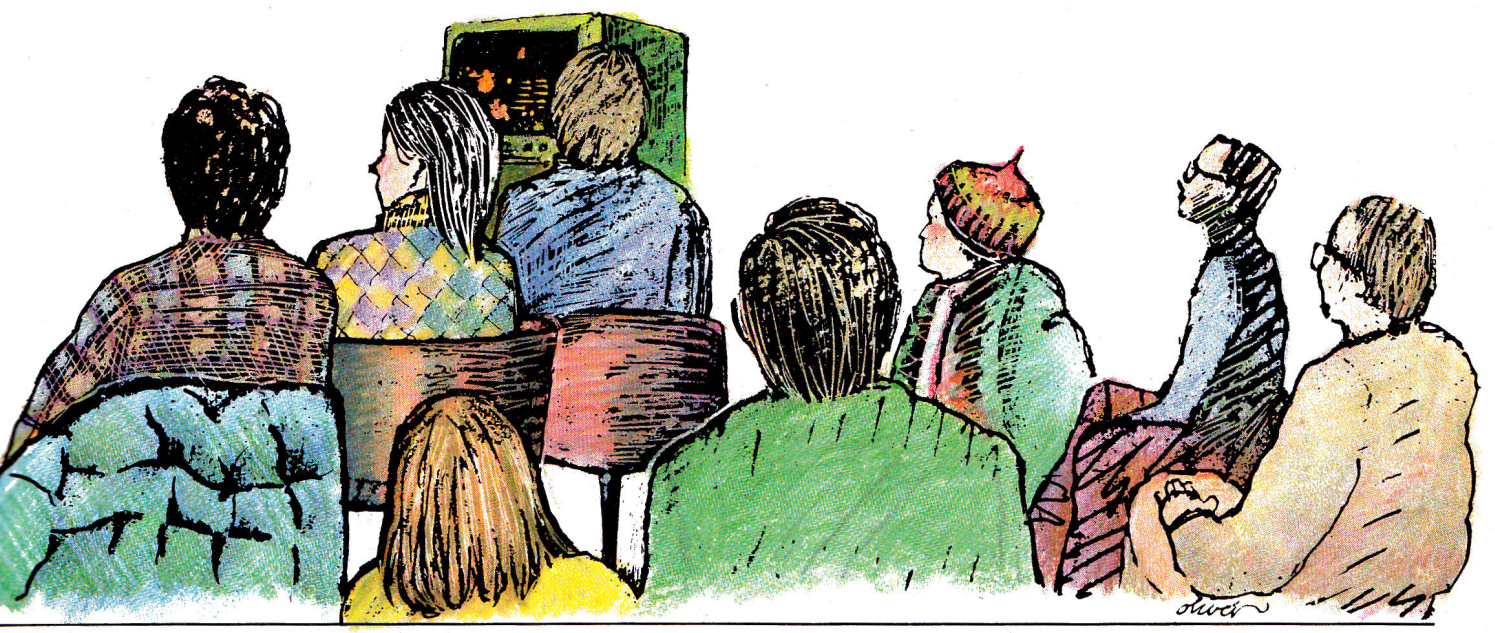

The questions were based on small-group research suggesting that people typically take on roles in small groups, and that small groups can only do their work effectively when members assume their roles. Using the computer's ability to process information in real time, I created groups made up entirely of people who saw themselves as taking the same roles.

I hoped that participants would experience, in the microcosm we'd created, a world populated by people like themselves, and that they could get to deal with their fears/hopes about the validity of the computer's categorizations of people. This section worked better than I hoped, as each group assumed a character in tune with the underlying forces of assignment.

Group 0 (the team leaders) became the noisiest, most boisterous group in the hall. There were constant debates about what decision the group should report to the computer, and fights about who should have command of the indicator device. Group 4 (the diplomats) was so easygoing that it was always the last to report its decisions as most members struggled to be sure everyone was happy with the decision.

Flower Trail Sequence: The first event was an animated color video graphic in which each group had a randomly moving color dot on the screen. Any time a group wanted they could place a graphic flower at the dot's position by throwing a switch. The size was determined by how they set their dial. I intended that the groups would develop some sensitivity to how their decisions affected a mutually constructed visual field. The flowers were remnants of their passing through the field.

Voting Rights: This sequence was a more complicated cumulative group video graphic. At each choice point there were eight options—some adding to a graphic design (for example, adding vertical lines) and some modifying the design (for example, changing colors, making mirror images on two sides, deleting the last group's con-

tribution). The first group to go was chosen randomly by the computer. Subsequent groups got the right to make the design only by guessing correctly what the previous group decided.

The computer used the following sequence: It would ask the group to choose, then ask each of the other groups to guess their choice; it showed (in real time) the guesses in a text area below the cumulative design. Thus each group had to be sensitive to the kinds of decisions other groups were making, and to develop a strategy based upon other groups' guesses.

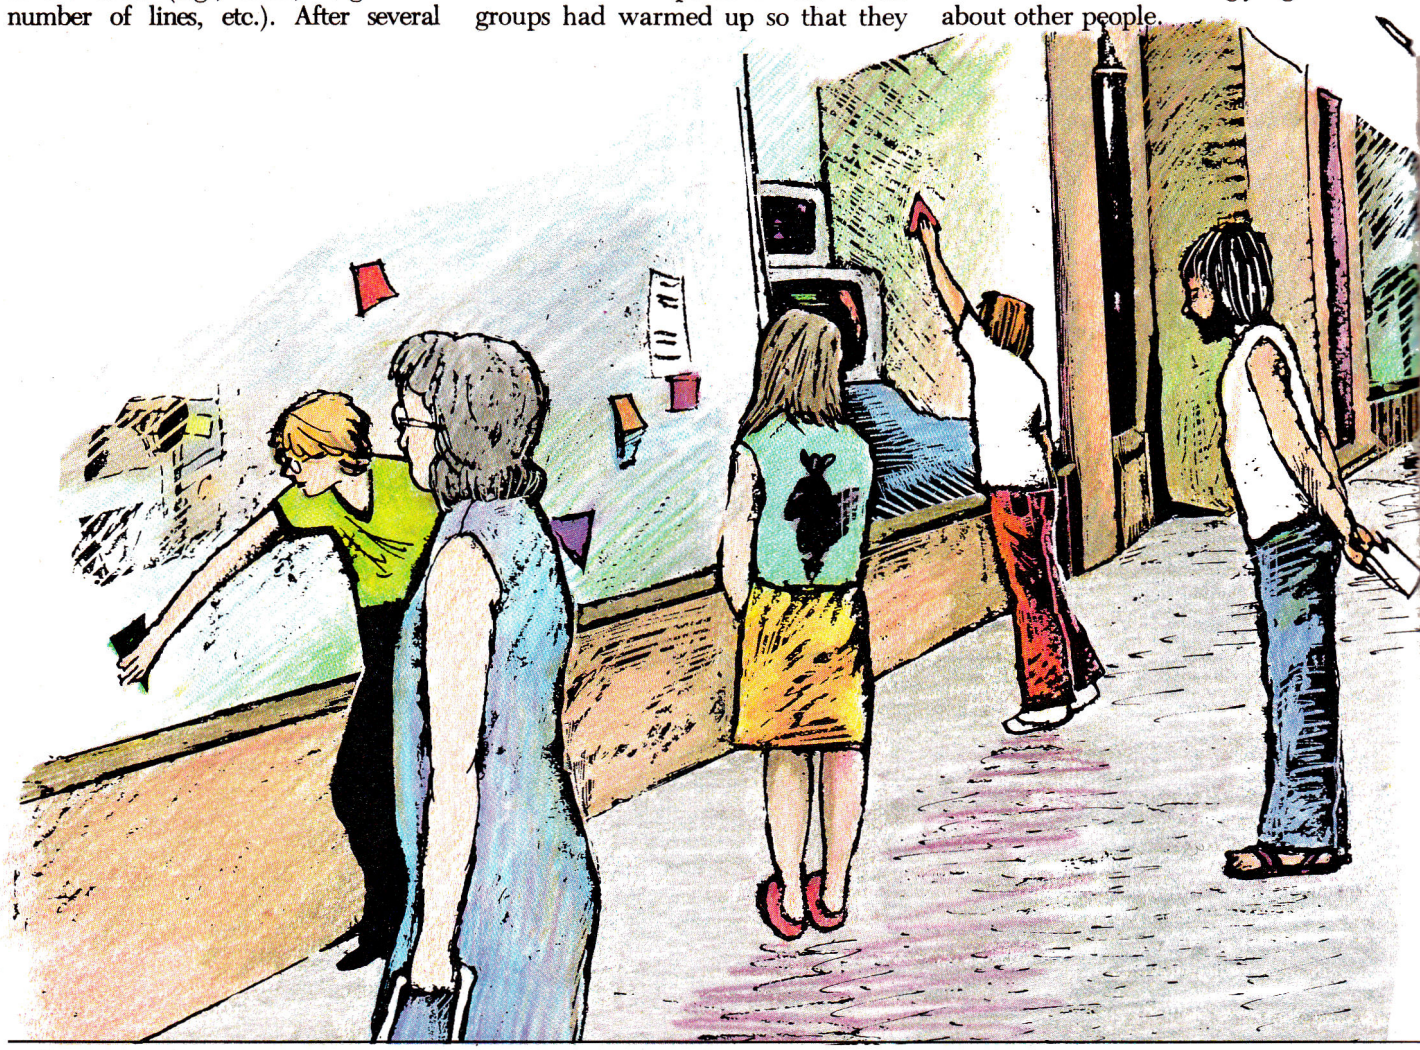

If they won by guessing correctly, they had to confer internally on what they wanted. The details of the generated graphic were determined by a combination of the option chosen, random factors, and parameters chosen by each group at the beginning of the event (e.g., color, length and number of lines, etc.). After several choice/guess responses the computer played back the growing decision from the beginning, in speeded-up fashion, so the audience could see a time-condensed record of their choices.

Life Choices: In the final sequence, "Life Choices," text on the video screen told a story. Before the story started, the computer let the audience groups vote for options such as the nature of the characters (e.g., compulsive, reflective, spaced-out) and kind of story (science fiction, political fable, pornography).

Then the story proceeded, but stopped at several decision points where the audience groups got to decide about the course of the story (e.g., should the hero respond to calls for help or ignore them?). Each group vote was displayed in real time on the screen. At this point in the event groups had warmed up so that they were yelling across the hall at each other trying to lobby for the choices they wanted.

Phantom Group: There seemed to be five groups in the event, but one was behind a curtain. People began to wonder about the fifth group as the evening progressed. This group always seemed to make choices that antagonized other groups. At the end of the evening the computer asked for applause for the participants group by group. When it got to the fifth group, I pulled back the curtain—to reveal that there was nothing there.

I had programmed the computer to generate the responses of the fifth group in reaction to what it sensed about the other four groups. I hoped this encounter would lead the audience to think about artificial intelligence and about which data and data channels we use in making judgements about other people.

"After a chance to experiment, participants were told they could contribute five notes to a community symphony."

Computerized Street Events

For decades artists have been searching for ways to broaden the audience for art—to take it out of galleries, concert halls and museums—and to engage the viewer actively and collaboratively in its realization. I used some of the special capabilities of computers to act on these intentions in the computerized street event project I undertook for the Bookspace Gallery.

I installed an interactive computer video graphic and sound event in their double store windows which look out a well traveled street. By touching sensors on the windows passersby could choose which of several video and sound events they wanted to activate, and then could interactively stage these events once underway.

Some of the events required collaboration between people in the two windows, and some remembered all previous participants' reactions to create events that accumulated over the four-week life of the event. The psychology of individual choice and the sociology of choice of the community of users were themselves important aesthetic elements of the piece.

Start-up: At 12 noon a timer turned on the computer and monitors. The text on the screen said "good afternoon" and "wait a minute while I load myself" and the computer loaded the program from disk storage. Then two eyes and a mouth placed themselves on the screen with a variety of emotional expressions and randomly-generated musical tune. The text at the bottom said "Hey you on the street I can interact with you cover spot 0 with your palm to start."

Once the passerby touched spot 0, the computer gave that person an opportunity for instructions, then proceeded to list and briefly describe four choices: "Memory Melody," "Community Standards," "Street Action" and "Life Choice."

Memory Melody: The computer explained that the participant could experiment with computer music by touching one of the six sensors on each window; each one generated a different note via the speakers aimed at the street. The computer also generated a related video line graphic (colors were determined by the note chosen, and position was determined by the number of people who had preceded the current participant).

After a chance to experiment, participants were told they could contribute five notes to a "community symphony." It ran through the notes (and associated video graphics) generated by the people before them. They could add their five notes, and then hear the symphony with their contribution added.

Several dilemmas confronted par-

Box 525 Dept. J • E. Setauket, N.Y. 11733

ticipants: should they select by sound or by visual line? Why were some of the notes different from what they had been able to generate in experimentation? (Even though both windows had apparently the same sensors, each window generated notes from different octaves.) How would the next person's contribution interact with their own?

Community Standards: In this event the computer generated five very different complex video graphics and asked the participant to vote for his/her preference. Each graphic was generated from a random selection of ten different parameters (each of which could have several values); for example, color, background color, scale, straight or curved lines, number of iterations, specific figures or plots manipulated, etc. When a participant voted for a particular design, a record of each value for each parameter that went into making that design was recorded in computer memory.

The computer calculated how often each value of each parameter had been a part of the most chosen designs up to that point. It then abstracted a design from the most popular underlying choices, which it reported to represent community standards up to that point. This design was an amalgamation and may never have itself been seen before.

I hoped the piece would confront people with issues about how their desires fit into the larger context of society's values, and how the sum of individual actions/preferences in a community can constitute something unanticipated and possibly undesired.

Street Action: I used the computer in this event to induce strangers to interact on the street and to become conscious of the details of the immediate environment. First the computer asked whether the participants wanted to do a solo or a duet, and invited them to ask a stranger to join if they were alone. The solo could be run from one window while the duet required cooperation in two windows. Then the computer allowed them to draw a design using the sensors in the windows (e.g., covering sensor #1 moved design right, #2 moved it up, etc.).

After a period of this drawing, the computer suggested this might be boring if continued. It offered to give them more options in their drawing (e.g., change colors, bigger repertoire of shapes, music with drawing) if they would agree to do actions in the street. If they agreed, it asked them to take some action. If they succeeded in the action, they were given a choice of more options and allowed to continue drawing.

There were three sets of actions, each requiring greater activity. The first set required no movement from the window (e.g., touching the window sensors with a time beat set by the computer). The second required movement about the street in the near vicinity (e.g., retrieving the street light #), and the third set required more movement (checking out the mailbox names in the apartment across the street or identifying an architectural detail of a building up the block).

The scene was fascinating to watch—strangers negotiating with each other across the windows and people moving frantically in front of the store window. The scene challenges common notions of the limits of people's interactions with inanimate objects.

Life Choices: Life Choices was a modified individual version of the "Life Choices" story that was part of Interactive Computer Theatre. Here no voting was required, and individual participants could make their own choices without being limited to what the audience as a whole had selected.

Memory Map

Computer capabilities could allow even traditional "wall art" to become intelligently interactive, thus occupying a new conceptual space somewhere between performance art and more traditional plastic arts. "Memory Map" looked like a subway map of Chicago with lines drawn over it. It was connected to a computer and video monitor. The viewer could use a pointer attached to a coiled wire to touch a "decision stick" or the lines on the map.

After someone started the piece by touching the start spot, the text on the screen asked the viewers to point to the subway line they wanted to "ride" on. It then asked what kind of ride they wanted to take (aesthetic/historical,

"I hoped to help viewers consider how they typically explore photos, and to break down the distance between people and two-dimensional art."

social commentary, artist's personal reflection).

From then on, any time they pointed to a spot on the map, the program shared a comment or reflection related to that spot, and which was in the spirit of their choice (that is, something aesthetic of note about that place or something from the artist's personal life).

At the end it allowed them to pick a spot and then type in their own personal reflection, which it stored in memory. They finally could touch spots on the map to see what reflections other viewers had left. The visual map was a repository for the memories of all who had participated. People left messages such as memories of events they had witnessed, special features of the places such as good restaurants, and generalized feelings.

Exploring Frames of Mind

"Exploring Frames of Mind" was a wall piece similar to "Memory Map." I hoped to help viewers consider how they typically explore photos, and to break down the distance between people and two-dimensional art. I also hoped they would think about what constitutes significant spots in a photograph.

Viewers were invited to explore a 4×5 foot blowup of a historically significant photo (Kent State Events 1969) with their fingers. First they were asked how they wanted to look at the photo (in the spirit of aesthetic criticism or social commentary). The computer reported how many previous viewers had selected the same option.

Then, as their fingers touched spots I had preselected as significant, a musical tone sounded and the computer shared reflections in the spirit of what they had chosen. Thus kinesthetically they could rub their hands over spots they considered significant, and see if someone else also found the spot significant. The computer would then share what the other person thought significant.

Hardware and Software Lessons

I have confronted some problems in this work, and worked out some solutions. Anyone working in similar settings or with similar systems should find the lessons I've learned valuable. Most of the problems arose from my attempt to take the microcomputer out of a predictable setting and have it interact with a wide range of people, some of whom were inexperienced with computers.

Instructions, Pacing, Reading Speed: I discovered in my early work in interactive art that those of us who work with computers take a certain rhythm of interaction for granted—i.e., type, hit enter key, look at CRT, respond with typing, etc. The general public was often unfamiliar with these responses, and became lost without specific instructions.

Often the interaction could not proceed until I gave a short personal instruction session. Thus, every program I now write has explicit instruction subroutines that flash on the screen at appropriate times. Also, I have moved away from using keyboards in the direction of specially-constructed unambiguous indicator devices. The instructions on the screen explicitly tell the viewers what they have to do to indicate choices—for example, "Cover spot 5 with your palm if you want to continue."

I tried programs where the procedural reminders were dropped after the participant had gone through a few sequences. Even this didn't work, however, because in a widely varying audience many of the participants found the experience so unusual that they needed constant reminders about what to do.

Reading speed causes another similar problem. I started out trying to estimate a speed which would allow most people to read the text on a screen before a timing loop moved the program to the next event. But some people complained it was too slow and some felt it was too fast. I tried building in a periodic choice-of-speed question, so participants could speed or slow the pace of events, but this didn't work because the changes in the interactive flow of events seemed to change the amount of time necessary. I now usually build in a "go on?" subroutine to pace events. Participants are asked to indicate when they are ready, and thus they can control the pace.

Both of these solutions—instructions and pacing—introduce a certain awkwardness into the flow of events, but they seem necessary for interactive events for a general public. Perhaps as people gain experience with computer interactions, the need for special help will diminish.

Self Running—Anticipating the Unanticipated: Part of the beauty of these events is that they can run and interact without their human creator around. Creating "automatic" operation in that kind of setting calls for some special system features.

The Apple disk system has autostart features that make this possible. I used an appliance timer to turn the computer on in the morning (a more elegant, but more expensive, method would be to use a clock-calendar board). The Apple disk boots itself up and looks for the "Hello" program, which can be anything the programmer wants. I usually had it flash a smiling face on the screen, say good morning, inform the viewer to wait a second while it loaded itself, and then load and run the main program that was on the disk. The program then announced it was ready and went into a greeting routine. The timer turned the computer off at night. (The only danger in this could occur if the timer should by coincidence turn the computer off during one of the rare times a disk was being accessed. Luckily it never happened.)

Some of my programs needed to keep a running account of choices viewers were making over a period of several weeks. The Apple's text file facility made this easy. At first I tried having the program store choices to disk each time people made them, but this interrupted the flow. So I built in an index to update the disk after each five new people interacted. During sign-on in the morning the computer loaded in the record.

Also in the morning the computer used the disk binary file facility to load in machine-language material (shape tables, music routines, graphics routines, etc.). This was necessary only once a day, and yet the program might be run several times. I located a byte in a safe part of memory which I set after the morning load. The program then branched around this routine on subsequent runs for the day.

For these interactive events in public spaces I couldn't count on people staying with the program through entire sequences—they might get tired, bored, confused, or their friends might want to leave. I therefore needed to build in intentional and non-intentional "revert to beginning" routines.

A sensor choice subroutine was usually part of these programs. The program presented material, asked viewers to make a choice and then went out to read which choice (sensor) they had activated. I usually reserved one sensor position for "restart," which participants could use if they wanted to go back to the beginning, if they were going to leave in the middle and wanted to reset for the next participant, or if a new participant came across an abandoned event and needed to start it over.

"Part of the beauty of these events is that they can run and interact without their human creator around."

I also built a loop counter into the sensor read routines so that an abandoned event would be started over automatically (e.g., if the program went out to read unactivated sensors so many times that it concluded no one was there). I was careful to ensure that these loops were closed and that subroutines were returned so the Apple did not get cluttered with more than its memory could handle.

I needed to build in error-handling routines too. The interactive and cumulative nature of the events, the unpredictable patterns of allowed and unallowed choices, and the potential for physical accidents make it impossible to totally debug these kinds of programs.

I have found that no matter how assiduously I work to anticipate what might happen, I miss some possibilities. I have built in specific error-handling routines for the errors, the program can diagnose—for instance, instructions on the screen that "group 2 needs to reset their switch before I can read it again," or "please move back from the window—you're blocking the spots."

Applesoft has an ONERR command that let me write a routine for unanticipated errors. If an error came up in the flow, the computer announced to the user, "I'm sorry I seem to have malfunctioned," played a special malfunction "song" I composed, checked out error codes to see if it could adjust or save the event, and if it couldn't, announced that it had to start over. Viewers enjoyed these sequences because they promoted the intelligent interaction aspect of the events and they reassured the viewers that computers are fallible.

Sensors in a Rough World: Somehow the participants needed to be able to communicate with the computer. Common computer wisdom stresses the need to make sensors reliable and to control their installation carefully. Most of the settings in which I worked made this rule hard to follow.

"Interactive Computer Theatre" required devices that could be comfortably and flexibly handed around in groups. I mounted switches and potentiometers in hand-sized flexiglass sculptures. Although I tried to mount them firmly, the constant handling occasionally changed the calibration.

The resistive drawing material used in the lines in "Memory Map" wore down after repeated applications of the pointer and hence the calibration of points changed. The photocell detectors in the store window in "Computerized Street Events" and in "Exploring Frames of Mind" were subject to constantly changing light and weather conditions and to variations among cells.

Wherever possible I built in periodic calibration routines, so the programs were constantly checking and adjusting their calibrations and, where possible, alerting participants to the changes. For example, when the computer determined the setting was too dark for photocells to function correctly, the program went into a routine

that announced to viewers it was "too dark to function."

Had I not been working on a limited budget, some of these problems most likely could have been overcome—through special factory fabrication of rugged dials or special infrared source-detecting pairs. Nonetheless, work in these settings requires that you be constantly aware of the abuse that sensors will be subject to.

Laying the connecting wires from computers to sensors also posed difficulties. For example, the "Interactive Computer Theatre" event took place in a 150 × 40 foot performance theatre. Because the hall was constantly used, there was only an hour and a half to set up prior to the event. This meant that I couldn't install the wires in an ideal configuration. The length of the wires (some over 150 feet) and the realities of the setting (wires laid under rugs on the floor) meant there was considerable "noise" to deal with. When I used the game controller inputs on the Apple, I needed to install 2.2k pull-up resistors to condition the signals. The Mountain Hardware D/A A/D board seemed able to handle the noise.

Acoustical noise was also a problem—I needed to amplify the sound made by the computer. Simply taking taps off the leads from the internal Apple speaker into a live input of an amplifier worked well enough to let me fill these public spaces with sound.

Two general principles underlie most of these problems and solutions in working in less than optimum public conditions:

1. If possible, pilot test the program and installation in the actual situation in which it will be run. I extensively tested my hardware and software in my home workshop; inevitably I uncovered new problems in the real setting.

2. Count on unanticipated events and try to incorporate them into the flow of the program. Part of the magic of interactive art is its ability to grow and spontaneously surprise participants (and even the maker).

Summary

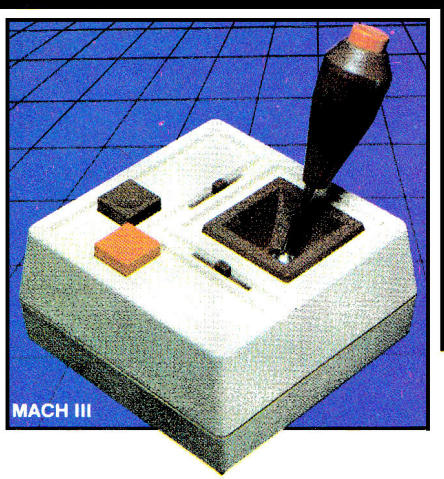

Interactive art events offer exciting new possibilities. They could not exist without the computer's unique abilities to remember, to intelligently respond, and to simultaneously handle many channels of information. The price, flexibility and accessibility of microcomputers bring these events into the scope of the independent artist or designer.

Interactive art should help the public to see that they don't need to be passive in their entertainment, art appreciation and, by extension, other activities. Technically, psychologically and artistically, the creation of these kinds of events presents significant challenges, but the rewards both for the participants and the creators make it worthwhile. ■

SPACE AGE CONTROL
JOYSTICKS

SUPERIOR QUALITY JOYSTICKS FOR APPLE II, IIE AND IBM PC

The HAYES MACH II and MACH III Joysticks provide the greatest precision and accuracy, more features and longer life cycles.

Added features are a totally coordinated 360° cursor control with fine trim adjustments on both axes, and a self centering feature which can be externally disengaged to allow for positive true positioning movement. In addition, the MACH III Joystick is constructed with a stainless steel ball as its main pivot and offers a push button switch on the stick handle to give the competitive edge for games, business and graphics applications.

How to quickly re

If you'd like to turn the agony of small business bookkeeping into the ecstasy of total control, you've come to the right place.

Because even if you're starting with a shoe box full of invoices or a pile of checks hiding under a pile of deposit slips, we can tell you how to centralize, organize and monitor all that information, and manipulate it in ways that will make your business a pleasure—all with an Apple® III Personal Computer.

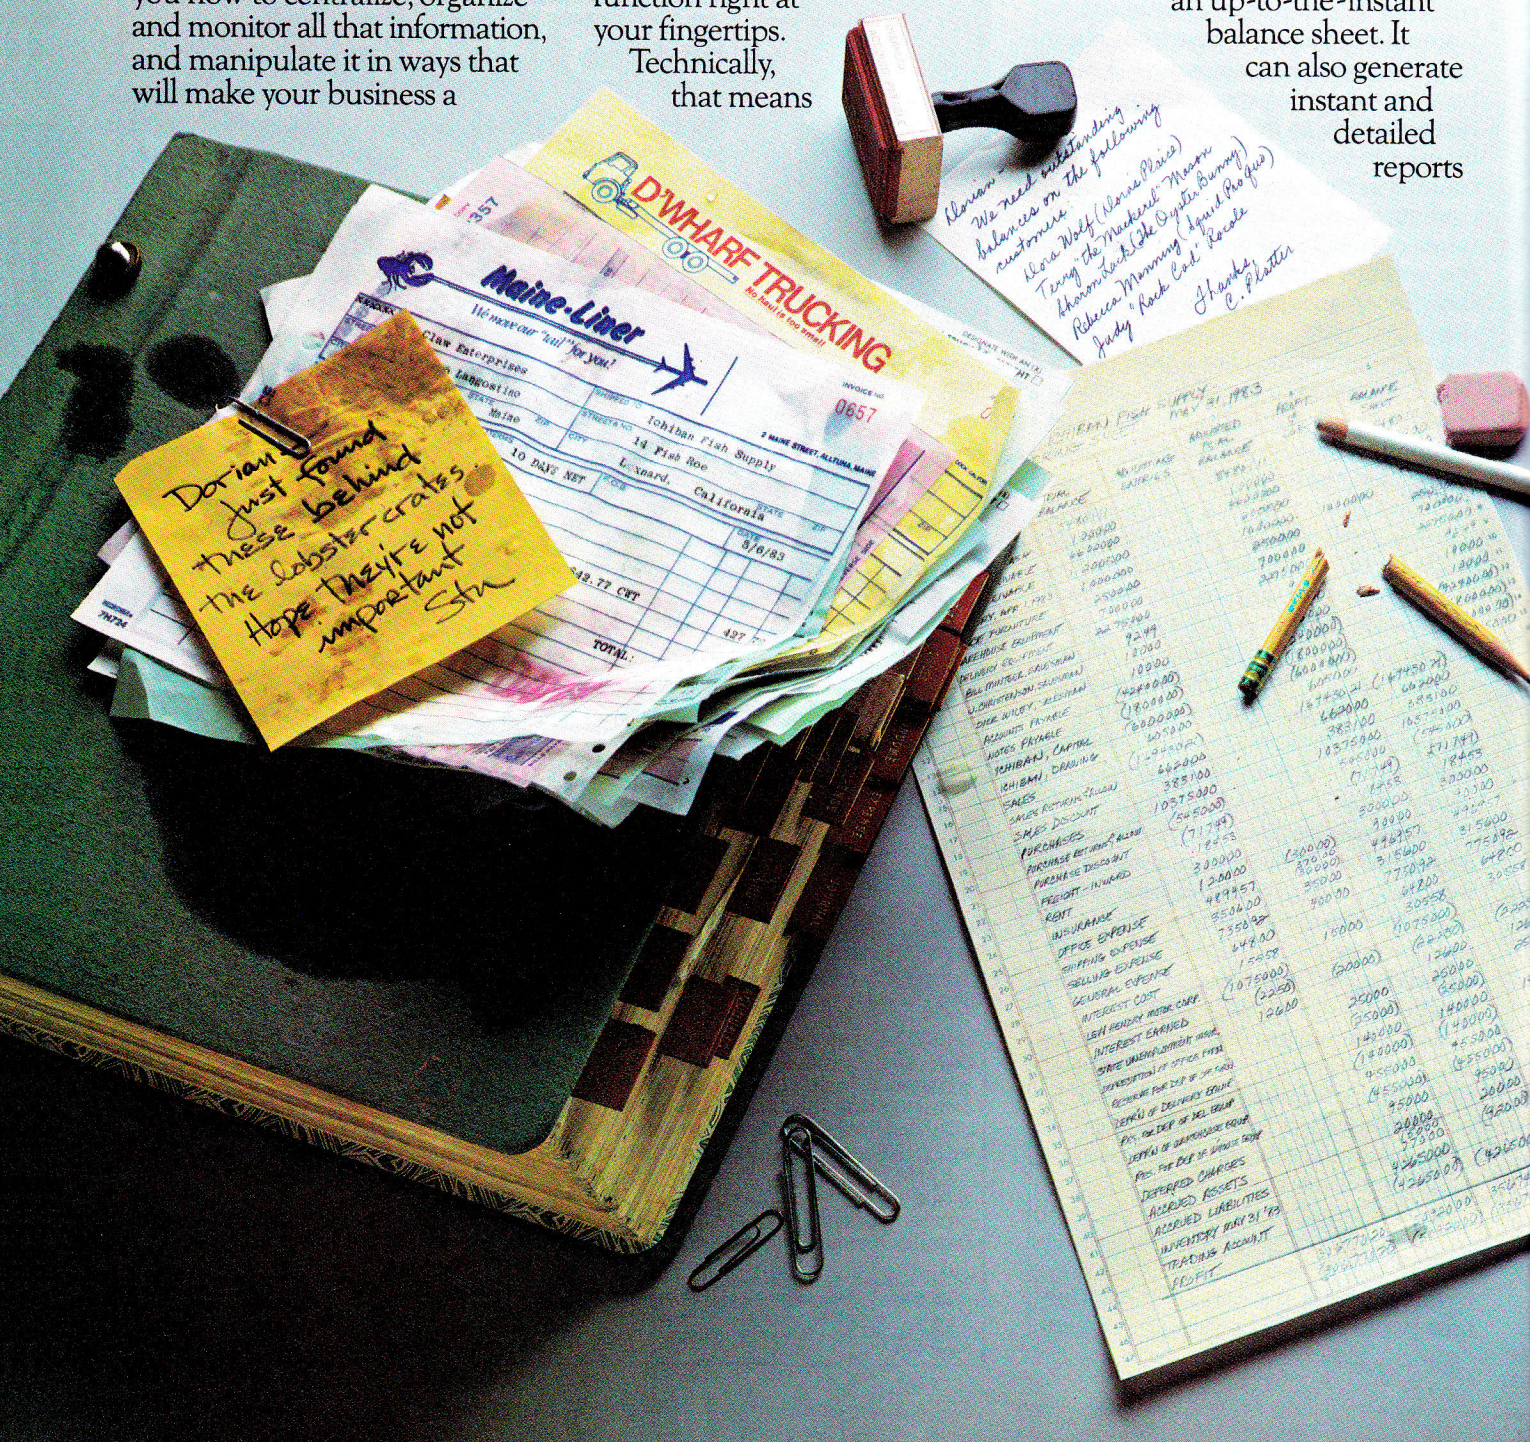

Attain instant financial status.

An Apple III, teamed with the BPI General Accounting Package, can put every basic accounting function right at your fingertips.

Technically, that means General Ledger, Accounts Payable, Accounts Receivable and Payroll—all in one package.

Meaningfully, that means you can turn numbers into answers.

With BPI, your Apple III can give you a snapshot of your company's financial condition, an up-to-the-instant balance sheet. It can also generate instant and detailed reports

gain your balance.

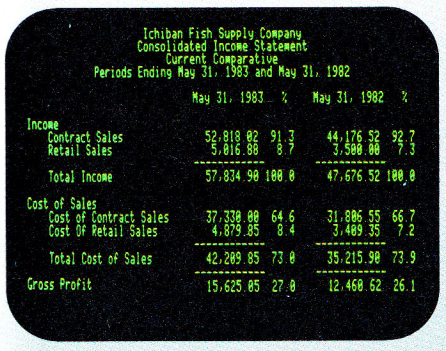

on your customers and vendors.

So you know who owes whom, how much, and how come.

And just how well your cash flow is flowing.

And where to give credit where credit is due (a customer inquiry feature allows you to make credit decisions based on the most current information).

You can also list your purchases by discount dates. And take advantage of them in no uncertain net terms. You can even keep payroll records without paying more, because it's part of the same package.

Ichiban Fish Supply Company
Consolidated Income Statement
Current Comparative
Periods Ending May 31, 1983 and May 31, 1982

	May 31, 1983	%	May 31, 1982	%

Gross Profit	15,625.05	27.0	12,460.62	26.1

Your Apple can generate instant income statements (with expense ratios) or balance sheets, and let you compare them to last month's or year's, then print them out to suit your banker.

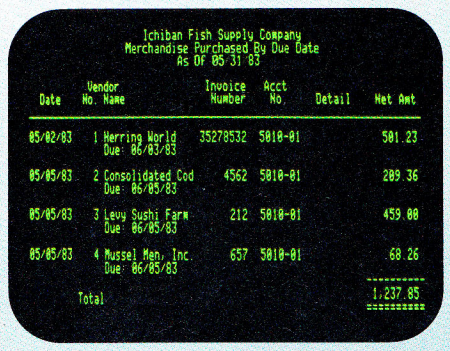

Profit from history.

In business as in life, experience is the best teacher. And the Apple/BPI system can provide you with instant comparisons of this-month-this-year vs. this-month-last-year, or this-year-to-date vs. last-year-to-date.

So you can quickly spot changing expense ratios and make decisions with 20/20 foresight.

The BPI General Accounting Package also lets your income statements be coded by location, department or product line. So you know where your money's coming from.

And where it's not.

Ichiban Fish Supply Company
Merchandise Purchased By Due Date
As Of 05/31/83

Date	Vendor No.	Name	Invoice Number	Acct No.	Detail	Net Amt
05/02/83	1	Herring World Due: 06/03/83	35278532	5010-01		501.23
05/05/83	2	Consolidated Cod Due: 06/05/83	4562	5010-01		289.36
05/05/83	3	Levy Sushi Farm Due: 06/05/83	212	5010-01		459.00
05/05/83	4	Mussel Men, Inc. Due: 06/05/83	657	5010-01		68.26
		Total				1,237.85

It can also allow you to take full advantage of merchandise discounts. So you'll know whom to pay, when to pay, how much to pay—and save a lot of clams in the process.

Make a timely statement.

Add an Apple Dot Matrix or Daisywheel printer to your Apple III, and you can print out your entire balance sheet in minutes.

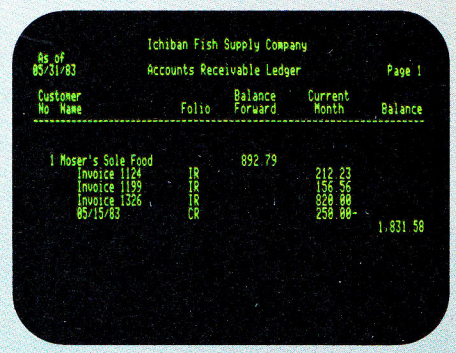

Or any number of reports, from cash receipts to payroll ledger to income. You can even print checks and customer statements.

The impressively professional results will make an important statement to everyone you deal with—including your banker.

More ways Apples pay.

There are more people in more places doing more things with Apples than with any other personal computer in the world.

As of 05/31/83
Ichiban Fish Supply Company
Accounts Receivable Ledger
Page 1

Customer No	Name	Folio	Balance Forward	Current Month	Balance
1	Moser's Sole Food		892.79		
	Invoice 1124	IR		212.23	
	Invoice 1199	IR		156.56

To avoid fishy transactions, you can instantly display customer's payments, charges and current balance. In this case, a few more cans of tuna would put Mr. Moser over his $2,000 limit.

Because for one thing, there's more software for Apples than for any other personal computer in the world. So the same Apple that handles all your accounting needs can also handle financial spreadsheets, word processing and electronic filing.

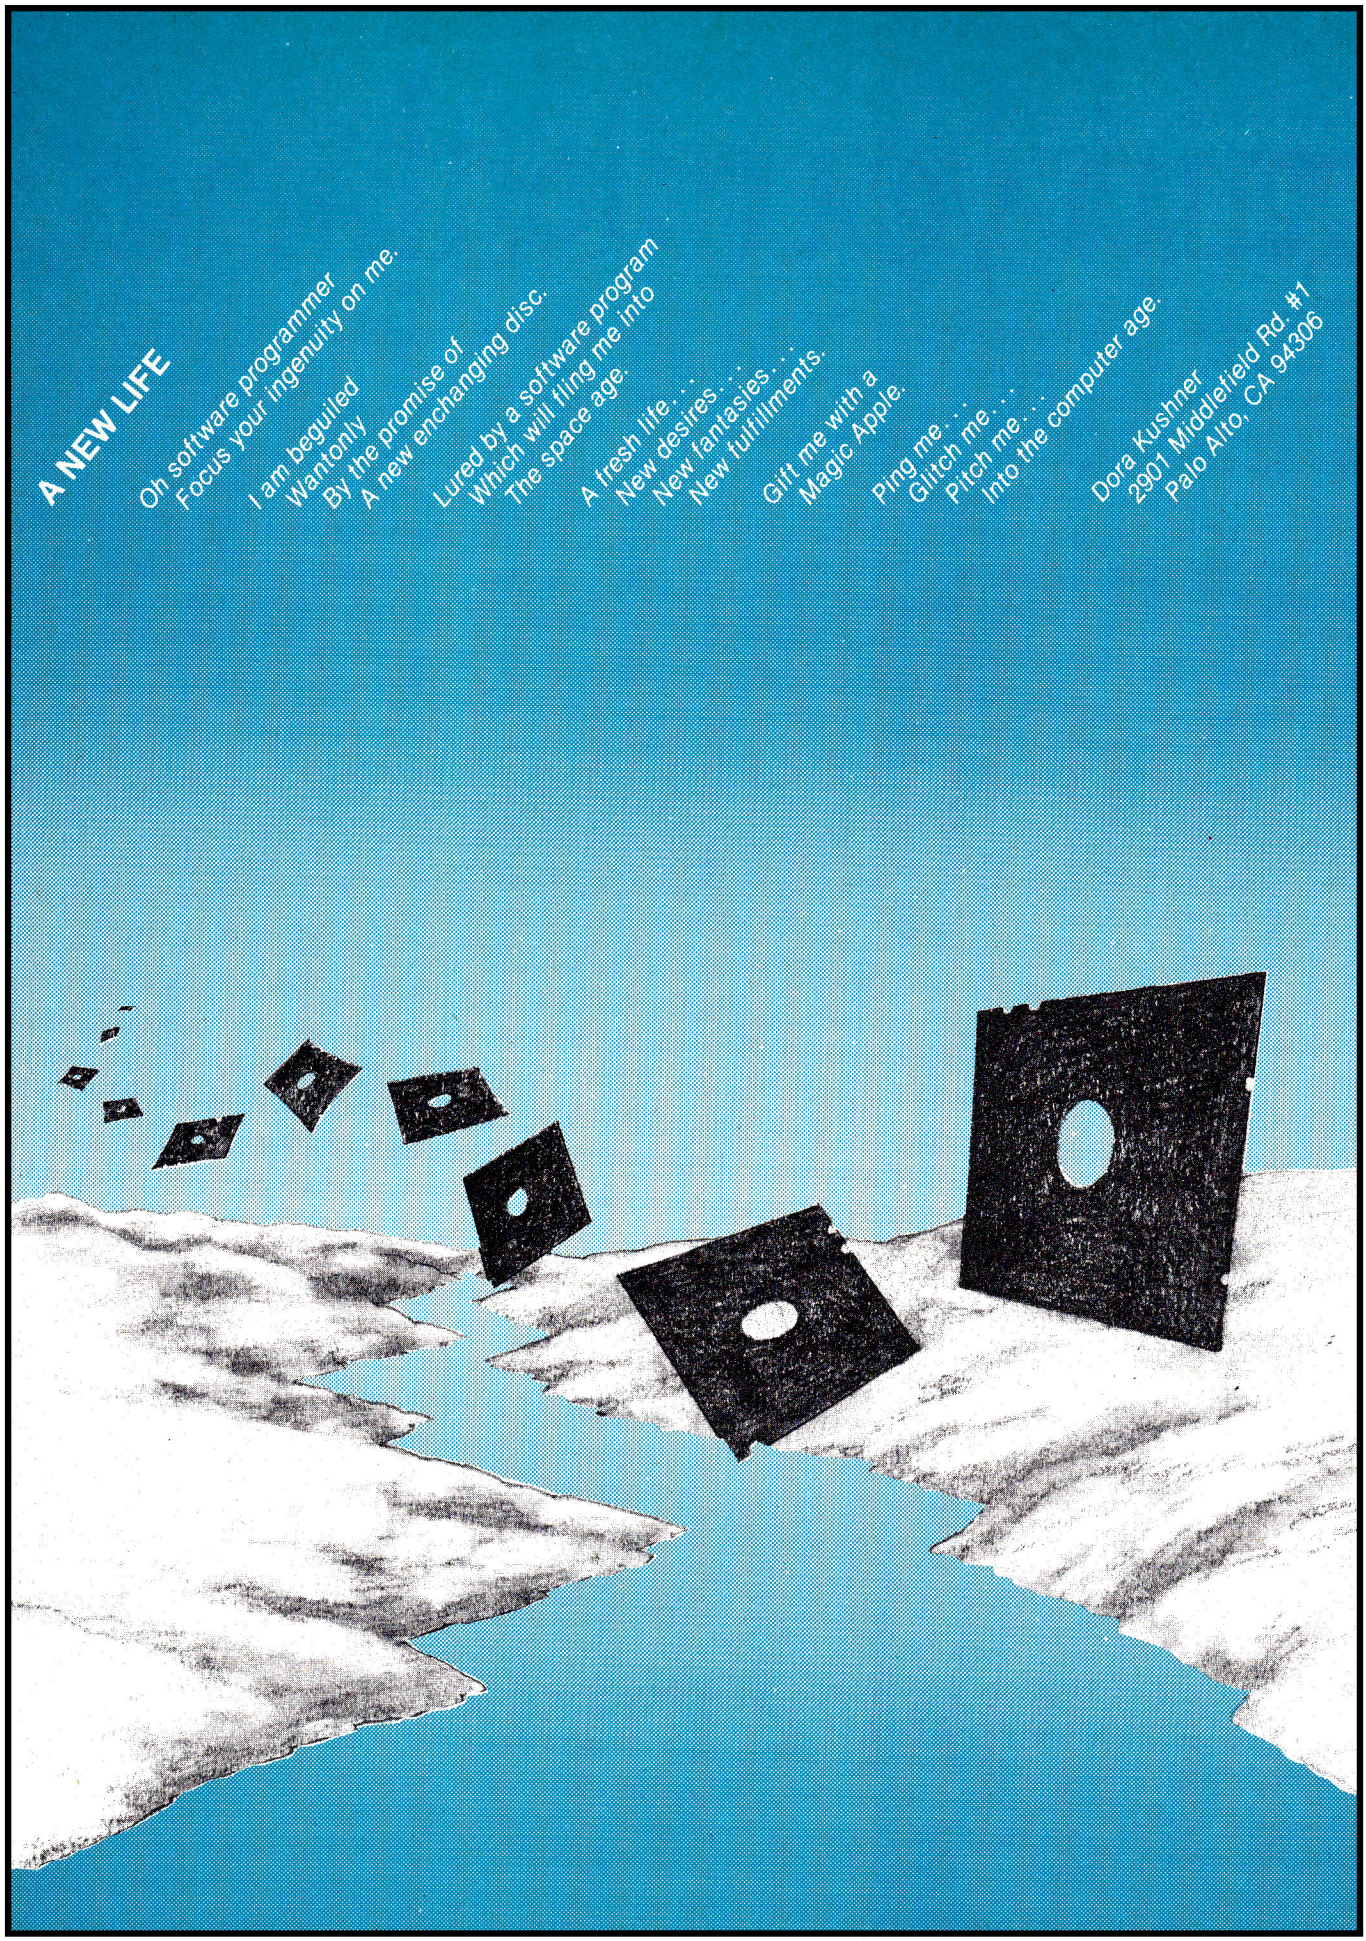

You'll also find programs that are designed specifically for your kind of business. Be it dentistry, architecture or swine herding.

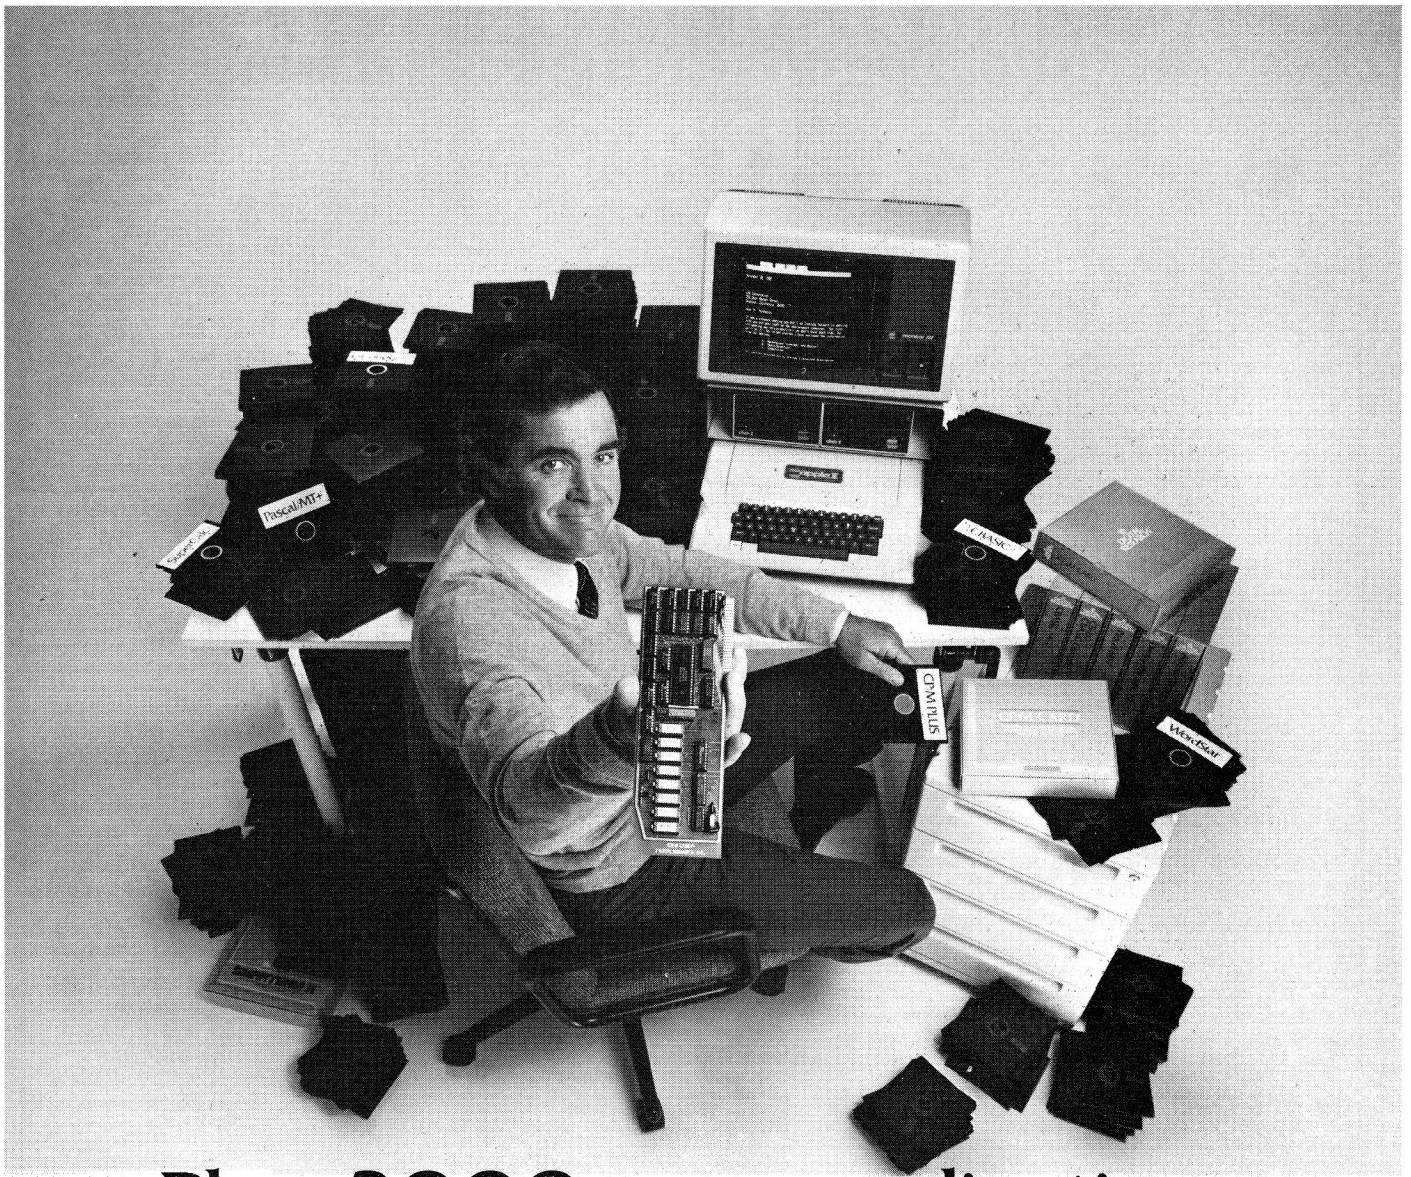

Of course, the best way to learn all the ways Apples can help you make better business decisions is to visit any one of over 1500 authorized Apple dealers.

So drop in. For a full account.

Plug 3,000 new applications into your Apple®

THE CP/M Card™ plugs CP/M Plus™ into your Apple.
The CP/M Card gives you the option of running your Apple II with the speed and capability of a professional Z-80 system with CP/M®-compatible software. You plug in the CP/M Card. Then choose CP/M or your standard Apple software at your option.

Plug into a big, new world of software.
The CP/M Card gives you instant access to the world's largest selection of microcomputer software—more than 3,000 CP/M-compatible applications, languages, and programming utilities. So, you, too can use professional business programs such as WordStar,® SuperCalc,™ Condor,™ and other high-performance software from Day One. Yet, you still have access to your present library of Apple software.

Plug into incredible performance.
Together, the ultra-fast CP/M Card and CP/M Plus run applications up to 300% faster than your Apple system! The CP/M Card is the only Apple II performance package that offers the speed and efficiency of CP/M Plus.

A plug about quality.
The CP/M Card was designed and built by Digital Research, the creators of CP/M, and Advanced Logic Systems, the most respected manufacturer of Apple performance products. So you know the CP/M Card is the most perfectly integrated Apple performance package you can buy.

Why just keep plugging along? The CP/M Card provides everything you need—including 64K of on-board memory, CP/M Plus, CBASIC,® GSX™-80 and full documentation—for just **$399.**

Now available through the CP/M library. See your local microcomputer dealer today. Or contact Advanced Logic Systems, 1195 East Arques Ave., Sunnyvale, CA 94086 (800) 538-8177. (In California (408) 730-0306.)

Advanced Logic Systems

The CP/M Card for your Apple II.

Also available for the Apple IIe.

Chase
A Creative Adventure

Killer dots on the prowl! Can you avoid them, negotiate the maze and still rack up points? There are six ways to try...

by David Phelps

I was sitting at an Apple II Plus recently, getting kind of bored, so I decided to make a game. It started out as two dots following a third dot around the screen (the third dot controlled by the person at the computer). But that soon became boring. So, to make it more interesting, I added walls that the dots could penetrate, but you could not. Furthermore, if you hit the wall you died. More development changed the walls into a maze.

After awhile, running around a maze pursued by little dots was boring, so prizes that were difficult to win, but worth points, were added.

After adding a title screen, some more options and a few sound effects, it became Chase, a creative adventure.

The instructions are simple. You are a little white dot being chased by a light blue dot and an orange dot (monsters). The arrow keys move you left and right while the A and Z keys move you up and down. If you run into the magenta walls or let the monsters catch you, the game is over. One point is received each time a monster moves and you survive. You also earn 1000 points if you touch one of the purple dots (prizes). The prizes disappear though, if the monsters run over them.

There are six variations of this game. Number one is the basic game.

Program listing.

David Phelps created this game, in his ninth grade computer class, for people who like to play maze games. It was voted the best game by all his fellow computer students at the Hyde Park High School in Austin, TX. Address correspondence to him at 8610 Robbie Drive, Austin, TX 78759.

APPLIED ENGINEERING
THE BEST PERIPHERALS FOR THE BEST COMPUTER

The TIMEMASTER
Finally a clock that does it ALL!

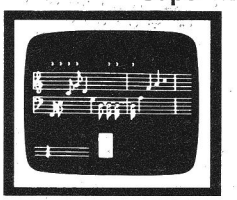

- Designed in 1983 using I.C. technologies that simply did not exist when most other Apple clocks were designed.
- Just plug it in and your programs can read the year, month, date, day, and time to 1 millisecond! The only clock with both year and ms.
- Powerful 2K ROM driver — No clock could be easier to use.
- Full emulation of most other clocks, including Mountain Hardware's Appleclock (but you'll like the TIMEMASTER mode better).
- Basic, Machine Code, CP/M and Pascal software on 2 disks!
- Eight software controlled interrupts so you can execute two programs at the same time. (Many examples are included)
- On board timer lets you time any interval up to 48 days long down to the nearest millisecond.

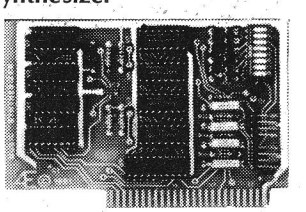

The TIMEMASTER includes 2 disks with some really fantastic time oriented programs (over 25) plus a DOS dater so it will automatically add the date when disk files are created or modified. This disk is over a $200.00 value alone — we give the software others sell. All software packages for business, data base management and communications are made to read the TIMEMASTER.

If you want the most powerful and the easiest to use clock for your Apple, you want a TIMEMASTER.

PRICE $129.00

Super Music Synthesizer

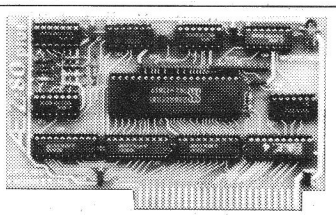

- Complete 16 voice music synthesizer on one card. Just plug it into your Apple, connect the audio cable (supplied) to your stereo, boot the disk supplied and you are ready to input and play songs.
- It's easy to program music with our compose software. You will start right away at inputting your favorite songs. The Hi-Res screen shows what you have entered in standard sheet music format.
- Now with new improved software for the easiest and fastest music input system available anywhere.
- We give you lots of software. In addition to Compose and Play programs, 2 disks are filled with over 30 songs ready to play.
- Easy to program in Basic to generate complex sound effects. Now your games can have explosions, phaser zaps, train whistles, death cries. You name it, this card can do it.
- Four white noise generators which are great for sound effects.
- Plays music in true stereo as well as true discrete quadraphonic.
- Full control of attack, volume, decay, sustain and release.
- Will play songs written for ALF synthesizer (ALF software will not take advantage of all the features of this board. Their software sounds the same in our synthesizer.)
- Automatic shutoff on power-up or if reset is pushed.
- Many many more features.

PRICE $159.00

Z-80 PLUS!

- TOTALLY compatible with ALL CP/M software.
- The only Z-80 card with a special 2K "CP/M detector" chip.
- Fully compatible with microsoft disks (no pre-boot required).
- All new 1983 design incorporates the latest in I.C. technologies.
- Red "CP/M WORKING" LED indicator, the Z-80 Plus does not interfere with non-CP/M programs.
- An on-card PROM eliminates many I.C.'s for a cooler, less power consuming board. (We use the Z-80A at a fast 4MHZ)
- Does EVERYTHING the other Z-80 boards do, plus Z-80 interrupts.

Don't confuse the Z-80 Plus with crude copies of the microsoft card. The Z-80 Plus employs a much more sophisticated and reliable design. With the Z-80 Plus you can access the largest body of software in existence. Two computers in one and the advantages of both, all at an unbelievably low price.

PRICE $139.00

COMING SOON: The Z-80 Plus for the Apple III

Viewmaster 80

There used to be about a dozen 80 column cards for the Apple, now there's only ONE.

- TOTALLY Videx Compatible
- 80 characters by 24 lines, with a sharp 7x9 dot matrix
- On-board 40/80 soft video switch with manual 40 column override
- Fully compatible with ALL Apple languages and software — there are NO exceptions
- Low power consumption through the use of CMOS devices
- All connections on the card are made with standard video connectors, no cables are soldered to the board
- All new 1983 design (using a new Microprocessor based C.R.T. controller)

JUST COMPARE!

The VIEWMASTER 80 works with all 80 column applications including CP/M, Pascal, WordStar, Format II, Easywriter, Apple Writer II, Viscalc, and many others. The VIEWMASTER 80 is THE MOST compatible 80 column card you can buy at ANY price!

PRICE $169.00

MemoryMaster IIe 128K RAM Card

- Expands your Apple IIe to 192K memory
- Provides an 80 column text display
- Compatible with all Apple IIe 80 column and extended 80 column card software (Same physical size as Apple's 64K card)
- Available in 64K and 128K configurations
- Bank select LED's for each 64K bank
- Permits your IIe to use the new double high resolution graphics
- Automatically expands Visicalc to 95K storage in 80 columns! The 64K configuration is all that's needed, 128K can take you even higher.
- Complete documentation included, we show you how to use all 128K.

If you already have Apple's 64K card, just order the MEMORYMASTER with 64K and use the 64K from your old board to give you a full 128K. (The board is fully socketed so you simply plug in more chips.)

MemoryMaster with 128K	**$249**
Upgradeable MemoryMaster with 64K	**$169**
Non-Upgradeable MemoryMaster with 64K	**$149**

Our boards are far superior to most of the consumer electronics made today. All I.C.'s are in high quality sockets with mil-spec. components used throughout. P.C. boards are glass-epoxy with gold contacts. Made in America to be the best in the world. All products work in APPLE IIe, II, II+ and Franklin (except MemoryMaster). Applied Engineering also manufactures a full line of data acquisition and control products for the Apple; A/D converters and digital I/O cards, etc. Please call for more information. All our products are fully tested with complete documentation and available for immediate delivery. All products are guaranteed with a no hassle **THREE YEAR WARRANTY.**

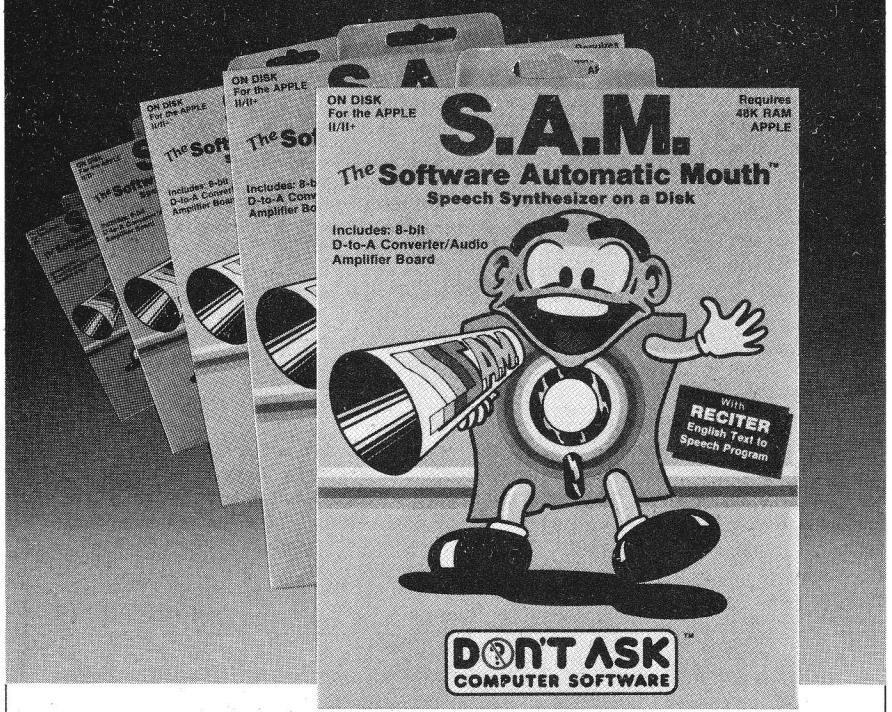

All Orders Shipped Same Day. Texas Residents Add 5% Sales Tax. Add $10.00 If Outside U.S.A. Dealer Inquiries Welcome.

S.A.M. GIVES YOUR APPLE THE POWER OF SPEECH

● **S.A.M.** is the **Software Automatic Mouth**, a speech synthesizer for Apple and Atari computers made by **Don't Ask. S.A.M.** uses your computer to simulate the sounds of human speech. You use **S.A.M.** to make your programs talk.

● **S.A.M.** does it all in software. It's a program – the only one of its kind. This means that **S.A.M.** has the power of a hardware speech device without the high price.

● **S.A.M.** expands the power of your machine. Adding speech is like adding graphics – suddenly you can do things you never considered before. Use **S.A.M.** to write practical things: learning tools for young children, business software with spoken instructions, programs that tell stories or read aloud. Write creative new games with characters that converse or opponents that crack jokes. **S.A.M.** is great fun to use, because it's a new playground for your ingenuity.

● **S.A.M.** is for anyone who can write a program, from the newest BASIC beginner to the machine language master. It's so easy to use **S.A.M.** to make a program talk, there's almost nothing to it.

● **S.A.M.** is capable of endless variety. You can control **S.A.M.'s** inflection, change the pitch of **S.A.M.'s** voice and the speed of **S.A.M.'s** speech. Use phonetic input to get perfect pronunciation; or use **RECITER**, the excellent English text-to-speech converter on the **S.A.M.** disk, for highly reliable results with ordinary English input.

With the new **KNOBS** feature you can create a variety of different voices for **S.A.M.** – not just higher or lower voices, but ones that sound like different people speaking. You design **S.A.M.'s** vocal personalities.

Get your Apple or Atari a **Software Automatic Mouth**, and discover the excitement of computer speech.

DON'T ASK INC
COMPUTER SOFTWARE

2265 Westwood Bl., Ste. B-150, Los Angeles, CA 90064. Phone (213) 477-4514

Dealer inquiries invited.

S.A.M. disk comes with: S.A.M., Reciter, and 4 demonstration programs.

Hear S.A.M. at your favorite dealer.

Or order direct from Don't Ask. Add $2.00 shipping to your check or money order; California residents add 6% sales tax (6.5% in L.A. County).

S.A.M. for Apple II-series computers includes 8-bit digital-to-analog converter and audio amplifier on a card. Requires 48K, disk. (S.A.M. uses 9K; RECITER 6K. S.A.M. can be loaded into a 16K R.A.M. card.) You will need a speaker. Suggested retail: **$124.95. Look for summer sale prices now through September 15, 1983.**

S.A.M. for Apple is now accessible from Pascal as well as BASIC and machine language.

S.A.M. programmed by Mark Barton.

APPLE is a trademark of APPLE COMPUTER, INC. ATARI is a trademark of ATARI INC.

difficult not to run into the walls when you go for the prizes. Variation four is almost impossible because the monsters move as fast as you, and they have the advantage of moving diagonally. Game five scatters magenta dots in random positions that you must avoid, because if you hit them the game is over. This variation occasionally makes it impossible to get the prizes, so if this happens, just commit suicide and start over.

Variation six is my favorite. In this game 90 prizes are scattered around the screen, each worth 1000 points. It is possible to go outside the interior maze by running over one of the prizes in the wall. I did put a wall surrounding the whole screen so you won't run off the edge.

I hope you like this game as much as I do. ■

Circle 176 on Reader Service card.

TAC T.M.

Tactical Armor Command

One last tug to the helmet strap—a reassuring glance at the line of powerful steel monsters and you know all is ready. From your command hatch you raise your hand and order "forward"! The air suddenly fills with the roar of engines and the rumble of treads, as the mighty dreadnaughts of the land start forward. You command a team of your country's finest armored vehicles in a mission to search and destroy the enemy.

T.A.C. is a game of World War II tactical armored combat. **You** pick a nation (from among the four major combatants—Britain, U.S.A., Germany and Russia). **You** build a combat team from their most powerful tanks, assault guns and tank destroyers. **You** command the team you've created in major operations against like forces of the enemy.

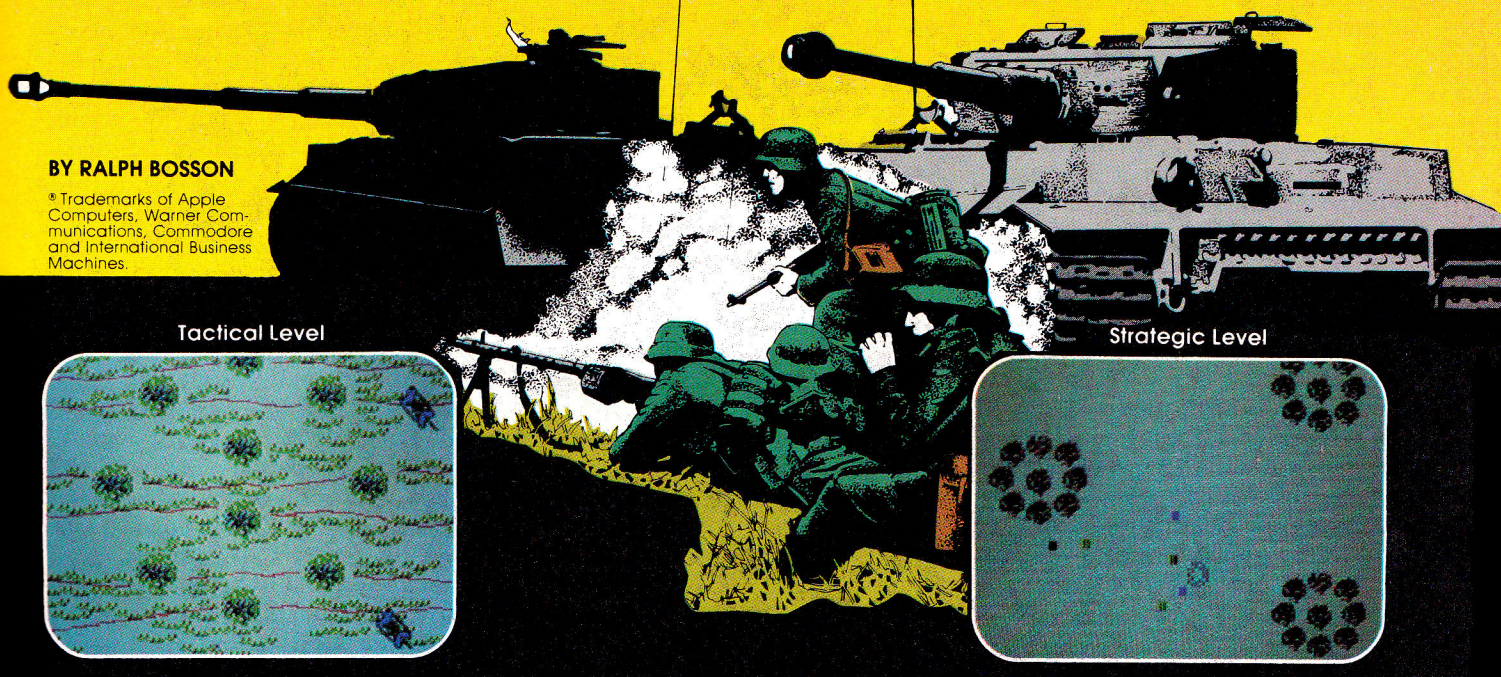

All the famous vehicles of the second world war are here—Tigers, Panthers, Shermans and JS II's; Jagdpanthers, SU 152's, Fireflies and T 34's, just to name a few. They have all been thoroughly researched and their important features programmed into the game. Each vehicle is distinguished by such elements as armor thickness (rear and flanks as well as front), fire power, speed, acceleration and gun traverse. Even minor points like fuel tank location can be critical.

The computer handles all the technical details. This lets you concentrate on making the same kinds of decisions the real-life tank commanders made. You search for the enemy, set your speed, aim your gun and knock out the enemy. The computer will handle all the rest.

Here are just some of the exciting features:

- **T.A.C.** can be played solitaire against the computer or as a two player (or two team) game with the computer as mediator.
- The most important armored vehicles of Britain, Russia, U.S. and Germany are available to command—40 in all.
- Choose from five different scenarios to play. Actions range from open meeting engagements to assaults against prepared positions.
- You pick the sides. You choose the weapons. A simple purchasing system has been provided to let you "buy" what you want in balance with your opponent.
- The results of combat are determined by the computer. It factors such critical elements as range, armor thickness (front, rear and flanks), tracking time, the speed and maneuvers of both the firing and target units, visibility and weapon adjustment to determine weapon accuracy.
- Special options include hidden movement, improved positions, smoke mortars, minefields, close assaults, overruns and indirect fire.

T.A.C. on diskette retails for $40.00 and can be played on the following computers: Apple® II's with 48K (Mockingboard™ Sound Enhanced!), Atari's® with 48K. Commodore® & IBM® versions coming this fall.

Sprites Break the Rules

Murmurs rising throughout the land have challenged Apple's leading role: "Newer micros have more." But now out of the West comes a system that does what everyone thought was impossible.

by Eric Grammer
inCider staff

I must have read three dozen letters to *inCider* magazine that bemoan the Apple's limitations in the area of graphics and sound. It's not that the Apple is a poor machine; it's just that a normal microprocessor is not designed to be a graphics or sound processor.

When you put a quarter in an arcade game, you get spectacular graphics and sound because the chips in the machine were designed with that specialized purpose in mind. The sounds might come from a special sound chip from General Instruments, for example, and video processing might be handled by a VDP (video display processor) from Texas Instruments or some other chip manufacturer.

Early microcomputers such as Radio Shack and Apple had graphics, but mostly as an afterthought (Radio Shack's character graphics were quite primitive). No one realized just how significant graphics would someday be. Besides, how much research and development can a couple of fellows (Apple) or a company (Radio Shack) do before getting a product to market? Eventually, research and development costs must be paid for via profits.

In other words, micros evolve. One could not expect Woz and Jobs to make an Apple IIe at first crack. There have been dozens of revisions and improvements in the history of the Apple. The IIe and Lisa are the newest steps in Apple evolution, and soon will come the Macintosh; perhaps it will be out before this article reaches the stands.

Companies such as Atari, TI and Commodore have all added specialized sound and graphics chips to their machines. Apple hasn't, and from what I gather, doesn't plan to. As nearly as can be determined, they'll let Atari and the others keep their game-playing machine market while Apple strives for a great business machine reputation. Lisa seems to be a small machine that does what the larger ones have been doing, but much more easily and cheaply. Lisa, from demos I've seen, has the ultimate user-friendliness.

Applesoft Graphics and Machine Language Graphics

Why hasn't Apple made Applesoft graphics as user-friendly as Lisa's? Why is Apple hi-res screen mapping more confusing than with any other micro? Why are Apple's sounds so primitive compared to those of cheaper competitors? And why is Apple the only major micro manufacturer that seems to be ignoring sprite graphics, a concept which has made Atari rich and can take a good deal of the credit for the early success of TI and Commodore micros?

I think the answer is that they've decided to let peripherals manufacturers deal with this area. Sound effects, voice and sprites all require specific types of peripheral boards with specialized chips mounted on them. Apple, rather than trying to cover all bases, has decided to cover a few bases well (i.e., business micros in general, business graphics, word processing, data processing and filing, printouts, and more).

This has left the field wide open for adventurous companies to develop peripherals for sprites and truly good sound. Creating hardware which actually runs sprite graphics and a sound chip is not that big a trip. But hardware that allows the use of both Apple graphics, sprite graphics, and sound simultaneously is a big deal.

And software that empowers the graphics and sound chips is also not too difficult to create. But to create a language that interfaces with the sprite graphics generator (also called the VDP) and sound chip, from Applesoft (thereby defining itself as an extremely powerful extension of Applesoft), is more of a challenge.

Well, Synetix Systems Inc., 15050 NE 95th St., Redmond, WA 98052, has accepted this challenge, and over the past months has developed a peripheral card, dubbed Supersprite, for sprite graphics, three-part music, and

Apple® à la Modem

$159.95 a slice

Here's a tasty addition to sweeten your Apple® and put you in touch with the world.

It's an amazing modem called **THE OPERATOR™**.

All of its sophisticated ingredients are tastefully tucked into one single circuit board to offer you the ultimate in simplicity as well as efficiency.

No costly add-ons or external boxes to complicate our easy recipe for instant telecommunications.

Just plug it directly into the slot of your Apple II, II+, IIe, the Franklin Ace® 100 or 1000, or the Basis 108, and you're ready to communicate.

THE OPERATOR comes to you with complete and easy documentation plus start-up software programs on disks.

This system is compatible with: ASCII Express Pro, Data Capture, Modem Magic II, TermExec, Transcend I, II, and III, VisiTerm, Z-Term, and many more.

So top off your Apple with this tempting delight at the very easy to swallow price of $159.95 for a simple touch of perfection.

THE OPERATOR has these added features: • 110/300 baud • full & half duplex • auto answer with disconnect • rotary, touch-tone™, key set compatible • totally self-contained (no RS-232 required) • single modem chip reliability • interfaces with most communications packages.

YES, I want to spice up my Apple®

much more. This peripheral has completely changed the Apple from a computer with poor graphics to an incredible machine with unlimited graphics (and sound) potential. With the board comes a language from Avant-Garde Creations Inc., PO Box 30160, Eugene, OR 97403, that allows full sprite graphics from the world's most popular Basic language, Applesoft.

With this new language, called Ampersprite, Applesoft is transformed from a language that cannot begin to create fast, smooth, flicker-free animation (especially of larger shapes) to one that performs such feats with ease. It also places many more hi-res colors at the user's disposal. It allows scrolling by moving a mere 768 bytes, not 8K! And it has multilevel video planes, making color-clash and background erasing no longer a problem.

The Big Weaknesses Of One-Plane Graphics

To expand on that, the Apple has color-clash problems whenever color-bit-on and color-bit-off colors are used in horizontally adjacent positions. And when objects move across the screen, not only color-clash but background erasing occurs. The best way to envision why the background erases is to think of a picture (2-D) and the view out of a window (3-D). If you want a dog in your picture to be on the left side of the "screen" rather than the right side, where he now is, you erase the dog, draw in the background that the dog was covering up, erase the background at the new dog position, and draw in the dog. However, if you want the dog outside your window to move to the left, you go out and move him left, via leash, calling, chasing, or bribing with Puppy Chow. In the latter example, one step, not four, is required.

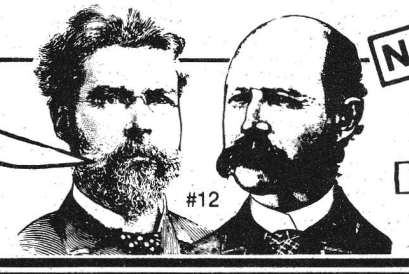

Now imagine a whole kennel-full of dogs let loose in a yard to play. If you draw them as they are at any one point, wait, and then want to draw them again, you might as well start over from scratch with a new picture. But if you're looking over the fence at this yard-full of dogs, you can imagine getting the dogs from one position to another by merely chasing them (unless one bites your leg). Notice, in this live, 3-D scene, that although dog A overlaps dog B and dog C partially overlaps dog D and dog E partially overlaps dogs B and C and dog F overlaps all of the above, because it's closer than the rest, all this causes no problem.

In the real world you do not have to erase or in any other way affect either the background or the other objects when you wish to reposition any or all objects. But in a one-plane picture, such as the Apple's high-resolution graphics screen, overlaps cause no end of problems. There can either be background screen bytes or single-object screen bytes at any one spot, with one video plane.

The dogs playing in the real-world situation above represent a multiplane situation. There can be many video planes at any one spot with Supersprite graphics. Dogs A, B, C and D may all be partially superimposed upon one another and no effect will be noticed and no erasing will be needed.

Another example is Saturday morning cartoons. Sometimes objects are walking along and the far background is moving slowly while the near background is moving more rapidly. This has 3-D effect and is sometimes called 2½-D graphics. I hardly need to tell you that the entire background is not drawn, erased and redrawn over and over as the characters move. This is another example of multiplane video. All it takes to get these great depth effects is to drag the near-background (transparent) overlay across the far-background while the moving-object-

ALL BEAGLE DISKS ARE UNLOCKED, COPYABLE, AND COMPATIBLE WITH APPLE II, II+ AND IIe.*

APPLE MECHANIC
SHAPE-WRITER / BYTE-ZAP UTILITY
by BERT KERSEY

SHAPE EDITOR: Keyboard-draw shapes for animation in your programs. Create **Proportionally-Spaced Typefaces** with special characters. Six fonts included. Listable Applesoft demos show you how to animate graphics and create professional Charts and Graphs.

BYTE-ZAP: Rewrite any byte on a disk for repair or alteration. Load entire sectors on the screen for inspection. **Hex/Dec/Ascii** displays and input. Educational instructions include experiments for making trick file names, restoring deleted files, changing DOS, etc.

MORE: Useful music, text and hi-res tricks for your programs. Clear educational documentation.

(**$29.50**: Includes Peeks/Pokes Chart & Tip Book #5)

APPLE MECHANIC TYPEFACES

26 NEW FONTS for use with Apple Mechanic programs. Many sizes of fully-editable characters.

BEAGLE MENU: Display only the file names you want from your disks (for example, only *Applesoft* files or only *Locked* files) for fast one-key cursor selection.

(**$20.00**: Includes Peeks & Pokes Chart)

ALPHA PLOT
HI-RES GRAPHICS/TEXT UTILITY
by BERT KERSEY and JACK CASSIDY

DRAW IN HI-RES on both pages using keyboard OR paddles/joystick. View lines before plotting. Use mixed-colors and Reverse (background opposite) plotting. Fast hi-res circles, boxes and ellipses; filled or outlined.

Compress HI-Res Images to 1/3 Disk-Space. Superimpose hi-res pages 1 and 2 or re-locate any rectangular image area anywhere on either hi-res page.

Proportionally-Spaced Hi-Res Type with adjustable character size and color. Upper and lower case with no htab/vtab limits. Sideways typing for graphs too.

(**$39.50**: Includes Peeks/Pokes Chart & Tip Book #4)

DOS BOSS
DISK COMMAND EDITOR
by BERT KERSEY and JACK CASSIDY

RENAME DOS COMMANDS and Error Messages. "Catalog" can be "Cat"; "Syntax Error" can be "Oops" or *anything*. **Protect your programs**—An unauthorized Save-attempt can produce a "Not Copyable" message, or *any* message you want. Also List-Prevention and one-key program-execution from catalog.

Customize DOS. Change the Disk Volume heading to your message or title. Omit or alter catalog file codes. Fascinating documentation, tips and experiments.

ANYONE using your disks (booted or not) will be formatting DOS the way YOU designed it.

(**$24.00**: Includes Peeks/Pokes Chart & Tip Book #2)

TIP DISK #1
by BERT KERSEY

100 LISTABLE PROGRAMS from Beagle Bros Tip Books 1-4. Make your Apple do things it's never done! All 100 programs are changeable for experimentation. Includes Apple COMMAND CHART with all Applesoft, Integer Basic & DOS Commands and Descriptions!

(**$20.00**: With 2 Charts: Peeks/Pokes & Commands)

UTILITY CITY
21 USEFUL UTILITIES by BERT KERSEY

LIST FORMATTER prints each program statement on a new line. Loops indented with printer Page Breaks. A great Applesoft program de-bugger! Also...

Multi-Column Catalogs for printouts, auto-post Run-number & Date in programs, put invisible commands in programs, create **invisible File Names,** alphabetize/store info on disk, convert dec to hex or Integer to FP, protect and append programs, dump text to printer...

MORE TOO: 21 Programs Total, a best-seller!

(**$29.50**: Includes Peeks/Pokes Chart & Tip Book #3)

New!

PRONTO-DOS
HIGH-SPEED DOS / DOS-MOVE UTILITY
by TOM WEISHAAR

Put HIGH-SPEED DOS in your Apple's normal memory, Language Card or Apple IIe's high-memory—

Function	Normal	Pronto
BLOAD HI-RES IMAGE	10 sec.	3 sec.
LOAD 60-SECTOR PROGRAM	16 sec.	4 sec.
SAVE 60-SECTOR PROGRAM	24 sec.	9 sec.
BLOAD LANGUAGE CARD	13 sec.	4 sec.

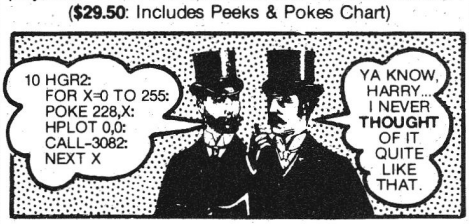

(Text Files: No Change)

Boot the Pronto disk or your updated disks, created with the normal INIT command. Compatible with ALL DOS Commands, GPLE® and most of your programs.

Move DOS to your Language Card or Apple IIe standard high-memory, freeing up **10,000** Extra Bytes!

15 Extra Sectors per disk, Catalog Free-Space display, new "TYPE" Command reveals Text File contents...

(**$29.50**: Includes Peeks & Pokes Chart)

FLEX TEXT
20/40/56/70-COLUMNS WITHOUT HARDWARE
by MARK SIMONSEN

PRINT VARIABLE-WIDTH TEXT on both hi-res screens with normal Applesoft commands (including Htab 1-70). Normal, expanded & compressed text with no hardware. 70-columns requires b/w monitor (not tv).

Add Graphics to Text or Text to Graphics. Run your existing Applesoft programs under Flex Text control. Fast, easy to use and Compatible with GPLE.®

DOS Tool Kit® font compatibility, or use the supplied Flex Text typefaces. Select up to 9 fonts with control-key commands. Custom text character editor included.

(**$29.50**: Includes Peeks & Pokes Chart)

FRAME-UP
HIGH-SPEED PRESENTATION UTILITY
BY TOM WEISHAAR

MAKE PROFESSIONAL PRESENTATIONS of existing hi-res, lo-res and text frames. *FAST* hi-res loads in 2½-seconds! Paddle or Keyboard-advance frames.

Unattended Shows are optional with each picture arranged and pre-programmed to display from 1 to 99 seconds. **Text Screen Editor** lets you create black-and-white text "slides" and add type "live" from the keyboard during shows. Mail copies of presentations on disk to friends and associates (or home to Mom!).

(**$29.50**: Includes Peeks & Pokes Chart)

New!

BEAGLE BASIC
APPLESOFT ENHANCER by MARK SIMONSEN

Requires Apple IIe (*or* II/II+ with RAM Card)

RENAME ANY APPLESOFT COMMAND or Error Message to any word, for program clarification or encryption. Plus add optional NEW COMMANDS—

ELSE follows If-Then's (as in IF X=2 THEN PRINT "Yes": *ELSE* PRINT "No"). **SWAP X,Y** exchanges 2 variables' values. Use **TONE** command to write music with no messy pokes & calls. **HSCRN** reads the color (off/on) of any hi-res dot. **SCRL** scrolls the text screen in *either* direction. **TXT2** lets Text Page 2 act like Page 1.

Also— GOTO or GOSUB may precede variables (as in "GOSUB FIX" or "GOTO 4+X". Escape-mode indicated by special ESC CURSOR. Replace Apple's awkward Graphics Screen Switch pokes with one-word commands. Change ctrl-G Beep to any tone. INVERSE REM STATEMENTS too! All GPLE® compatible.

These new functions occupy ZERO extra memory!

(**$34.95**: Includes Peeks/Pokes Chart & Tip Book #6)

BEAGLE BAG
12 APPLE GAMES by BERT KERSEY

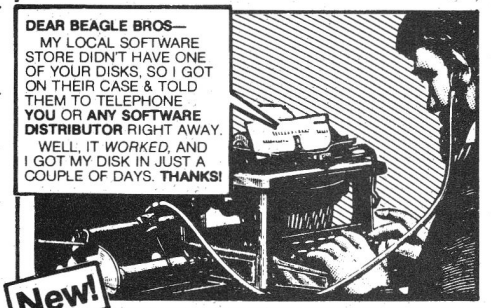

COMPARE BEAGLE BAG with any single-game locked-up disk on the market today. All 12 games are a blast, the price is right, the instructions are crystal clear, *and* the disk is COPYABLE. You can even *change* the programs or list them to learn by seeing how they work.

Twelve Games from the Applesoft Ace, Bert Kersey—TextTrain, Wowzo, Buzzword, Magic Pack & more...

Excellent Reviews— (see Jan-83 *Softalk,* page 148).

BEAGLE MENU too: Description under "Typefaces".

(**$29.50**: Includes Peeks & Pokes Chart)

New!

DOUBLE-TAKE
2-WAY-SCROLL/MULTIPLE UTILITY
by MARK SIMONSEN

LISTINGS & CATALOGS SCROLL Up *AND* Down, making file names and program lines much easier to access. Arrow-keys control scroll direction. New Applesoft LIST FORMAT: each program statement on new line for *FAST* program tracing and de-bugging.

Variable-Display shows all of a program's strings and variables with current values. **Cross-Reference** shows line nos. on which each variable & string appears. Better **Renumber/Append** to *Merge* programs (not just connect end-to-end). Also **Auto-Line-Number**, Instant Hex to Dec Converter, Program Stats, Eliminate/Redefine Cursor, Free Space-On-Disk... All GPLE® compatible.

(**$34.95**: With 2 Charts: Peeks/Pokes & "Tips & Tricks")

RUSH the following disks by First Class Mail—

overlays, in front, go through their multi-picture walking sequences.

Multiplane video provides an immense advantage. Cartoon makers would be lost without it. The ease of use compared to single plane video is tremendous. And this ease translates itself into speed. Remembering the dog scenario, think about repositioning all dogs by simply moving them to new places. Now think about erasing and redrawing every dog. The second task takes many times longer to accomplish.

Refresh, XDRAW, and Masking

If you've ever tried to program a colorful game with a background, you've quickly run into the background obliteration problem. You may have decided to make the parts of the background that the objects occasionally cover up black, so there's nothing erased when a shape goes by. Or you may have decided that you'd XDRAW to erase and draw so that the background always gets restored.

The trouble with the "black" solution is that it merely avoids the problem and doesn't always look too spiffy. Strike one. The trouble with the XDRAW solution is that although the background is restored perfectly, the shape itself turns unwanted colors as it traverses the colored background. Strike two.

An alternate solution is to go through elaborate rituals where the entire screen, or a part of it, is redrawn between each frame. Sometimes "masks" are created, to handle the color interactions. What if you want the entire screen to be full of moving objects, especially large moving objects? You need to deal with upwards of 192 bytes to move a 32-by-32 spaceship with normal bit-mapped animation. With sprites you need only change the X coordinate (one byte).

It's true that Applesoft vector shapes also need only coordinate changes to make them move, but it's also true that since they draw only one or two dots at a time, they are too slow for adequate animation in most faster games. Block shape animation from Basic is too slow; assembly-language block shape animation (bit-mapped) is not only too complex for any but the most seasoned programmer, but also too slow for lots of large shapes to be animated at once. So I'll have to call, "Strike three!"

In essence, one could say that all the good programmers have been inventing all manner of elaborate crutches to make up for Apple's weakest aspects: spritelessness, limitation to six colors, only one video plane, color-clash, and slow graphics done on a jumbled-up hi-res map. In short, Apple's video performance, discounting text, is a far cry from what it could be.

Supersprite Graphics Compared To 6502 Graphics

1. Machine language and Basic Supersprite graphics (using Ampersprite) are much faster than 6502 graphics. In fact, merely using Ampersprite as an Applesoft enhancement allows a Basic programmer to program animation that will compete with current Apple assembly-language animation!

2. Machine language and Basic Supersprite graphics are much easier to do than 6502 graphics. Since there are no elaborate masking, XDRAWing, refreshing, bit-shifting, preshifted shape sequences, etc., to go through, but just coordinate changes, you could certainly program a game in assembly-language Supersprite graphics much faster than with conventional methods.

3. Most Supersprite Basic programs done so far are incomparable to the 6502 Basic equivalents. The simple fact is, the results in the Ampersprite-using Supersprite programs, easily and quickly achieved, would have been impossible in 6502 graphics.

4. Sixteen colors are standard for Supersprite sprites and patterns, certainly a refreshing change from the six standard Apple hi-res colors. Nonstandard colors can be created by mixing two or more standard colors in either type of graphics. For example, orange can be created by mixing yellow and red.

5. Nearly three dozen sprite planes let you perform wild 3-D animation effects that are depthy and quite impressive.

Now at this point I'd talk about weaknesses in Supersprite graphics—the things normal Apple graphics do that aren't so easy to do with Supersprite graphics—except for one thing. With the Supersprite Avant-Garde system, you get both VDP and 6502 graphics on the same screen at the same time, with absolutely no

"There is no either-or situation here. You get both Apple graphics and sprite graphics."

color-clash or other interaction between them.

Am I saying that all your best Applesoft scenes, binary pictures, compressed pictures, slide-show pictures, and other 6502 based pictures and shapes can now be joined on the screen with VDP-based sprites? Yes! Impossible? I might have thought so, but when I ran this system through its paces, the evidence proved it has been done.

So what I'm saying is that there is no either-or situation here. You get both Apple graphics and sprite graphics! You needn't wonder whether to use vector shapes or sprites, Apple's six colors or VDP's 16 colors, etc. You get to have your cake and eat it too. This is truly the most important innovation in Apple history.

It's even possible to have the graphics happen while the line numbers controlling the graphics slowly scroll by on the same screen, passing behind the graphics shapes. It's possible to HPLOT and XDRAW one moment and manipulate a sprite or pattern or text character from Ampersprite the next. And it's not switching between two screens or screen flipping—it's Apple 6502 video and VDP video synchronized via complex hardware!

Now you'll have everything the competing micros have relative to sound and graphics as well as Applesoft and all it can do—all together in one place at one time. The creative program possibilities are inspiring.

The Privileged Few

As things stand, a small fraction (about 1 percent) of all Apple owners are writing commercially viable programs, games, etc., because, although lots of Apple owners can program well in Applesoft, few can program in assembly language. Of the few who can program in assembly, only a small percentage can make good graphics and animation—assembly-language animation is much harder than it ought to be.

This new sprite graphics system can help change that. Not only is assembly-language graphics much easier, but you usually don't need to use assembly language in your graphics applications! This means that you're not likely to need more speed or smoothness than accessing Supersprite from Ampersprite can provide, so you'll probably be able to program most games, utilities or other applications right from Basic using the old familiar FOR... NEXT loops and ON X GOTOs, etc. I'm talking about commercially viable programs that are in many ways superior to normal Apple assembly-language graphics programs.

Logo, Pilot, and turtle graphics of all types have not made the impact they could have because you still end up with slow, jerky graphics that are not commercially viable. GraForth is

Circle 93 on Reader Service card.

A REPORTING SYSTEM FOR A SPREADSHEET DATABASE
(for any VisiCalc© or Lotus 1-2-3™ User)

Most database systems consider rows of data fields as records. The 3-D concept promoted by Abacus says to consider an entire report as a record. Therefore, visualize "pages" of reports stacked-on or scattered-around your desk; these would constitute your database.

VIZ-A-MERGE™

With Viz-A-Merge (Namely-A-Merge System) you can "cut and paste" sections of spreadsheet reports together to form new reports - - - Electronically!!! As a spreadsheet utility Viz-A-Merge allows you to combine sections, rows, columns, or single cells from any number of spreadsheet pages into one new report, or into an existing report, then recalculate selected formulas. For example, you could "cut" total year end columns from Department reports and the consolidated reports, then "paste" them together for overall company analysis. Or, you could place a total sales row into an income statement and recalculate all formulas.

VIZ-A-CON™

With Viz-A-Con (Namely-A-Consolidation System) you can add 3-Dimensional capability to your spreadsheet program. As a Report Writer to your database, Viz-A-Con allows you to select records ("pages"), get sub-totals and totals for all number fields, and have customized labels on the final report. For example you can perform hierarchical consolidations (Dept., Div., Company) or time period roll-up (Day, Week, Month, Qtr., Year). You can consolidate up to 50 files in one process and you can tie together as many as 80 processes in one group. Then play "what if" with VisiCalc and regenerate all reports in one single step.

Each Product has a simple Question & Answer procedure to assist you in organizing your report processes. You can create a complete reporting network from a spreadsheet database. They have the ability to "remember" the steps they went through to create the final reports. You can use your spreadsheet program to recalculate new data, then use our products to regenerate all new reports in one single step. Also, you can set-up special formulas to calculate additional data fields within the new reports. You can customize titles, row and column headings, footnotes, etc. for each report.

Both products include sample sessions which are easy to understand, allowing the average person to learn them in only 15 minutes. They are both compatible with dBase II™ (IBM), PFS Graph® and a host of popular products.

Abacus Associates is dedicated to producting products that allow users to create customized reporting systems tailored to the way they manually organize their data.

Please order either Viz-A-Merge or Viz-A-Con directly from Abacus Associates. Send your check or money order to Abacus Associates, 6565 W. Loop South, Suite 240, Bellaire, TX 77401, or credit card customers may CALL TOLL FREE (800) 547-5995, ext. 170. In Nebraska, (800) 642-9606, ext.170.

(In Illinois 1-800-322-4400)

an exception here; you can use it to create acceptable games with market potential, but GraForth is difficult to use and it doesn't deal with more than one video plane, nor give you sprites, nor add ten more colors, nor increase assembly-language graphics speeds nor allow commercially viable programs to be written in a simple Basic. GraForth is a compiled language which compiles everything as you're typing it in. You cannot use it to enhance Applesoft. Unfortunately, you must use it to replace Applesoft.

I mention the above not to pick on any product or person or language—each of the above has its place. Each is good. GraForth does wonders with 3-D rotations and other such effects, for example. However, none of the above has the potential to go above and beyond current Apple assembly language. None gives you a simple Basic language that can be used from Applesoft to create graphics as good as current Apple assembly language. None give three tones and realistic sound effects all simultaneously, without stopping the action. (With the system I'm talking about here, sound processing does not interrupt graphics processing—you get simultaneous sound and graphics.)

"Easy sprite graphics will give hundreds of thousands of Apple owners a crack at the brass ring."

In short, none of the above languages has the potential to transform the Apple's graphics and sound forever, thus multiplying the number of good Apple programmers, since the "privileged few" who now write most everything have always depended upon the fact that they knew assembly graphics while the bulk of Apple programmers did not.

Easy sprite graphics will give hundreds of thousands of Apple owners a crack at the brass ring.

Supersprite Utilities

Good interface software between the Supersprite board and the Apple involves ironing out some wrinkles to create a language usable from Applesoft. And other types of utilities to convert any part of any type of shape or scene (6502 graphics or VDP graphics) into a VDP sprite must have taken a bit of doing. But sprite creation, scene creation, painting, maze creation, sprite editors and user-definable games are now complete, and you'll be seeing them in *inCider*.

Memory Use

Memory locations from $300 to $3EA and from $800 to $DFF hold the peripheral card interface program and the addressable-from-Applesoft language (Ampersprite) I've been referring to. This means that you'll start your Basic programs anywhere from $E00 to $6000, depending upon whether you plan to use hi-res Apple 6502 graphics or not and how long your program is. If you don't need the enhanced Applesoft but wish to program from assembly language instead, then you can use the peripheral card interface program ($8C long) at $300 and skip the rest. There are no other memory requirements, except keeping slot 7 reserved for the peripheral board.

It's also possible to use the card from Basic without using Ampersprite, and using only the $8C-long interface program. You merely CALL the appropriate numbers to read and write to the video RAM and video registers.

The audio can be accessed directly via POKE commands to two different I/O addresses. An easier way to create sounds is to do it from Ampersprite. Simple commands will give you any or all of the sound effects and musical chords you've been missing for so long in your Apple (three tones and sound effects all simultaneously, with no pause in animation—the sounds will continue, with no effect on graphics, until you use a command to stop or change them). You can add sound from Apple's built-in speaker for complete stereo four-part harmony!

Educational Importance

Supporting education is increasingly important in the micro industry, but no one quite knows how the teachers

can end up with all the software they want and need. One attempt at addressing this problem has been Apple Computer's support of large publishers. This may work out in the long run, but in the short run it merely will underline what we already know: there aren't that many people out there, especially teachers who already work full time, who can write viable software. Sprites for the Apple, *the* most popular computer in the schools, will surely help build good quality educational software.

These programs can incorporate speech routines using the Echo II speech synthesizer built into the Synetix Supersprite card. People who already own an Echo II, or who are not interested in speech, can buy the Synetix Supersprite, without speech chips, at lower cost.

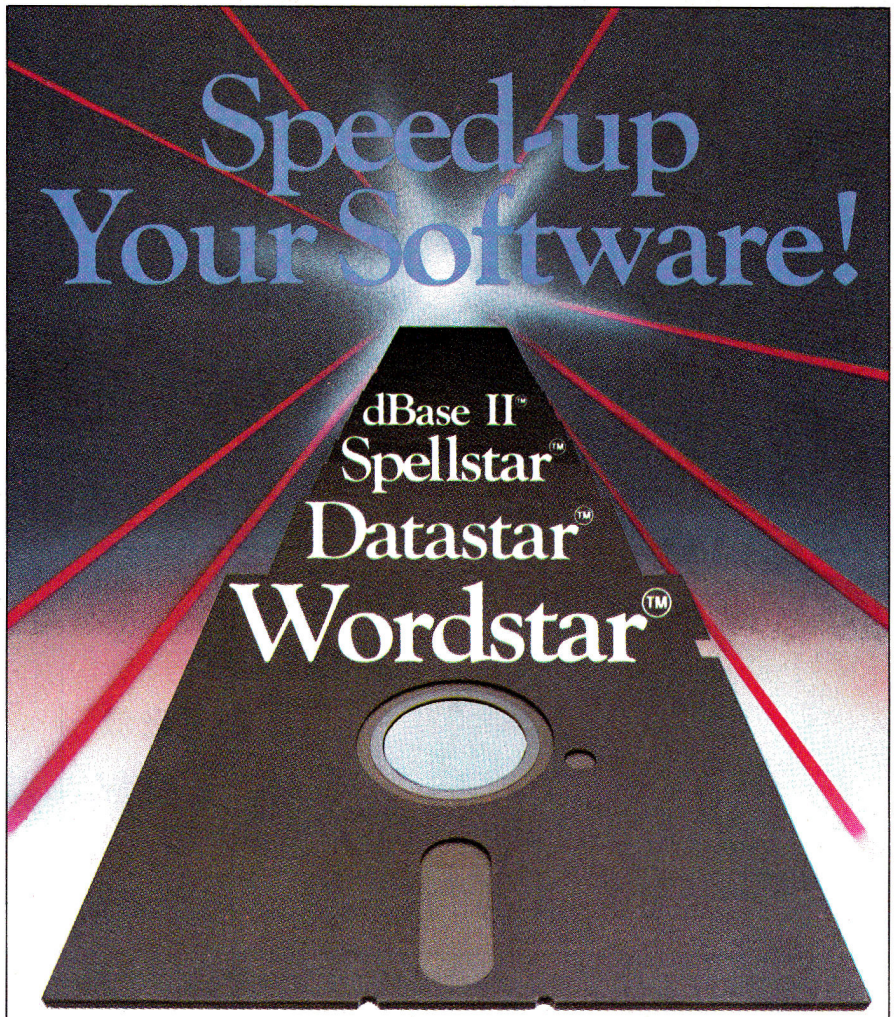

I talked at length with the folks at Avant-Garde Creations, and they assure me they want to offer programming/user support for the Synetix Supersprite system, and be open to software ideas from teachers/administrators. They will consult with educational experts to make software of maximum impact, and be ready to create additional utilities, programmer's aids and new languages if the need arises. Enhancements to Ampersprite are another possibility. Avant-Garde will also update software, if the need arises.

They plan an ongoing program of educational software creation so that the purchase of the system is merely the beginning of the acquisition of a long, coordinated line of excellent educational software.

Next month I'll report on all the details of the Synetix Supersprite system, its accessories, utilities, manuals, users, dynamics, abilities, and specifications. You'll see how to get it, what software is available now, and what software will be available soon. Perhaps I'll even have a few sample routines to show you.

To some people a sprite is a drink. To others it's a woodland elf. To me it's the way to get my Apple to do what no Apple has ever done before, and to program easily what used to be programmed with much complexity and ritual. ■

Tasman Turtle

Tool
Tutor
Tutee
Toy

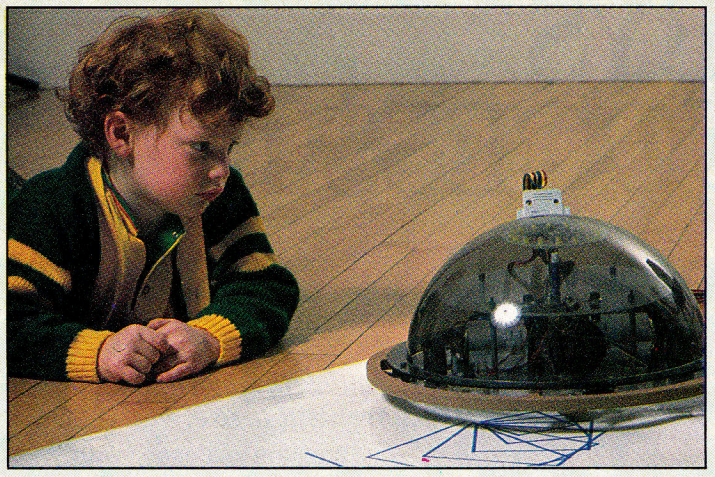

Teaching the turtle to talk required some trial and error with phonetic spelling. Mathilda apparently lost her Aussie accent in Cambridge.

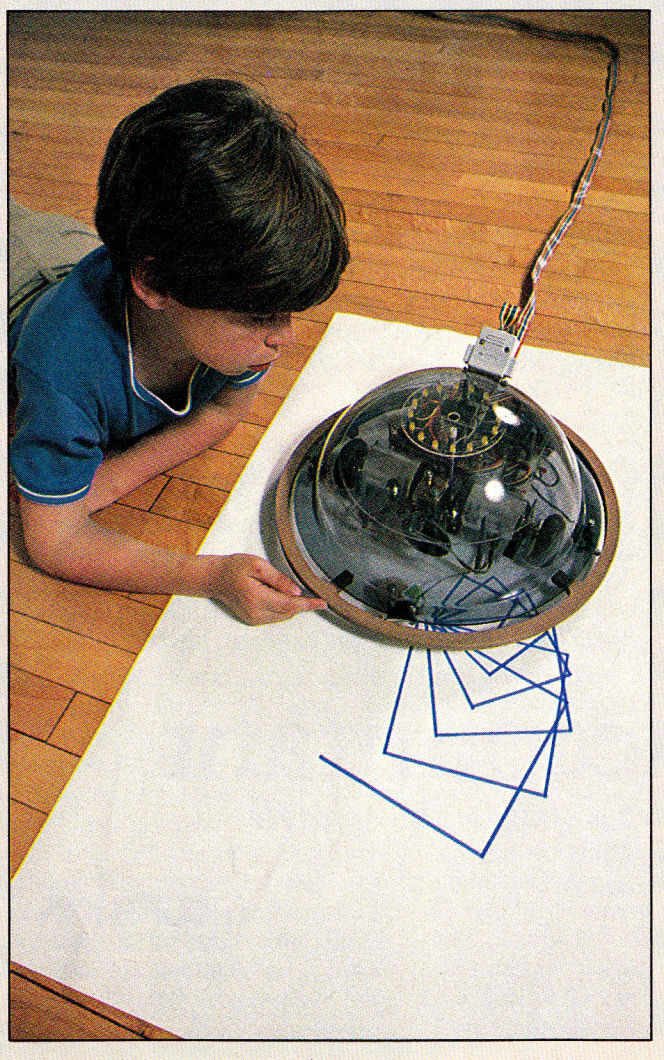

Who's in charge here? When these Monadnock youngsters met up with Mathilda, the talking programmable robot from Tasmania, they soon learned to take control. She responds to Applesoft and Logo commands, as well as turtle talk.

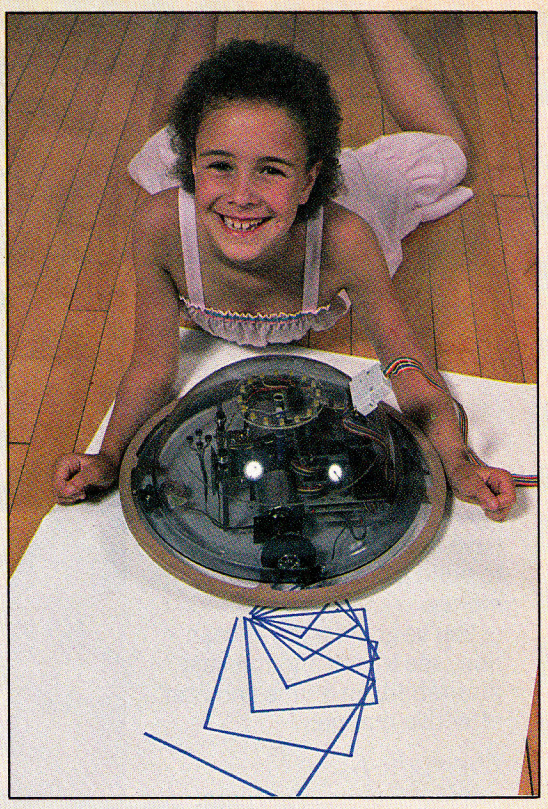

photos by Frank Cordelle

Four-year-old Ian discovered the mechanism that makes Mathilda glide and spin with breakneck (for a turtle) speed.

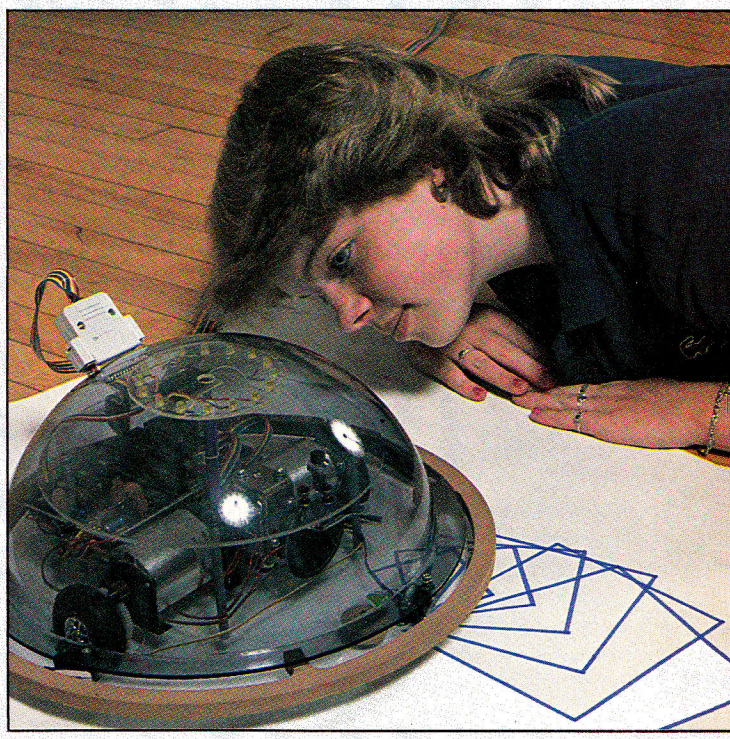

Built-in sensors enable the turtle to interact with its environment.

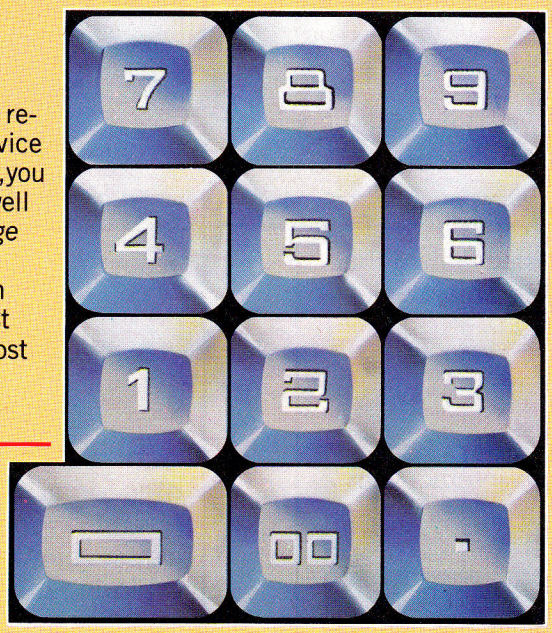

Kids respond creatively when they're given the tools—canvas, crayons, clay. . . or computers. Tahewa enjoyed exploring this new medium.

Like the original Terrapin turtle, Mathilda gives Logo a new dimension. She waltzes through a program with PENUP, or leaves her trail with PENDOWN.

KEYS TO SUCCESS

Whether you have a small retail company, manage a service agency or run a cattle ranch, you have to do something else well to build a business—*manage money.*

You've got to analyze cash flow, see trends and forecast profitability in a time and cost effective manner.

The right fit.

A computerized accounting system makes sense, but finding the right software is important. The "home checkbook" programs are easy to use but they don't have the advanced reporting capabilities you need. And many small businesses just don't need the complexity or the cost of the modular systems.

Practical Accountant is a single entry, small business accounting program that comes complete in one package. It's friendly enough to balance your checkbook, yet sophisticated enough to give you the kind of money management information you need for a successful business.

We could have called it "Accounting Made Easy".

Practical Accountant is designed around fundamental accounting procedures. Even if you don't know much about accounting it is an ideal program.

The manual explains basic accounting terminology and provides a comprehensive tutorial. It will take you step-by-step through the process of setting up a complete, single entry accounting system you can begin using right away.

It's quick to learn and convenient to use.

The program guides you with easy-to-use menus and provides on the screen prompting. "HELP" is never more than a keystroke away. It even does some of your work for you like organizing entries in date order even if you don't.

It's very flexible. You set it up to fit your business.

Practical Accountant allows you to set up your "Chart of Accounts" (income and expense categories) with up to 50 categories, 300 sub-categories and with 20 tax type definitions—all defined by you. The manual shows you how to set up an accounting system for a small business, complete with samples.

Cash Flow Reporting— money management information.

Perhaps the most valuable feature of the program is the cash flow reporting capability. You can look at cash flow by category, by sub-category and by tax type to analyze profitability, tax consequences and general performance. All of your reports are professionally formatted and you have access to profitability information that leads to sound business management.

There is more to this success story.

If you would like to know more about Practical Accountant your dealer can give you a great demonstration and a brochure with a more complete story, or call Softlink TOLL FREE at 800 633-6300 (in CA 800 222-1244) and we will send you the brochure.

Apple computers and Apple compatible software are expanding the learning possibilities for the seven million Americans who are mentally retarded. And this is true not only for the mildly retarded who can read and interact with a keyboard. Even profoundly retarded persons—those who are thought to need total care—can benefit from computer interaction.

Dr. Mary S. Wilson of the University of Vermont and Bernard J. Fox of Laureate Learning Systems Inc. have developed an animated program that can be operated by a single switch input. A pacifier is plugged into the game paddle port of the Apple, and profoundly retarded children can interact with the software by sucking. And talking software, such as the First Words program, can be used to instruct the retarded in language and mathematics.

Skills that many take for granted, such as typing, can be difficult for the retarded to master. Ruth Lambert of the Mount Hope School in Nashua, New Hampshire, has developed a one-hand touch typing program, the recipient of an honorable mention award from Johns Hopkins University, that teaches fast and accurate typing to the retarded. Users can type with one hand or with head or mouth gear.

Computers can also be used as prosthetic devices. For mentally retarded persons unable to speak, speech synthesizers can be highly effective communication systems. Even games with animation provide training for the retarded. Playing games helps develop appropriate eye tracking. Hand-eye coordination can be improved as well.

The development of communication skills is a primary goal for the retarded, and the computer can be an important tool in this process. As Dr. Leo D. Geoffrion of the State University of New York has written, "The computer acts as a patient tutor, posing questions to the student and checking each answer. The computer initiates and controls all interactions, while the student's role is primarily one of responding to questions posed by the system."

Special educators and professionals in rehabilitation programs for retarded citizens are becoming increasingly aware of microcomputer technology. But much more teacher training is needed to ensure that the retarded are not excluded from the microcomputer revolution. ■

number being converted is negative. It does this in line 5120. But first the LEN function is used to return the number of digits in QF$. For a short value like 1.2E+02 the answer is 7, but the length could be as large as 14. Numbers that are less then zero or negative have their minus sign removed in line 5140. The RIGHT$ function is used to form a new string by removing digits from the right side of the existing string. For example, if the string was SS$ = APPLE and a RIGHT$(SS$,4) was used, the new string would be PPLE, or the four rightmost digits of APPLE. In the case of line 5140, RIGHT$ removes all but the leftmost or "sign" digit.

RIGHT$ is used again in line 5150 to create QE$, the absolute value of the exponent. After converting QE$ to the numerical variable QR with the VAL function, the sign of the exponent is extracted from QF$.

The function MID$ is used since it allows any portion of the string to be returned. Using the string SS$ = APPLE again, a MID$(SS$,3,2) would return PL. After specifying the string, the first numeral indicates the first character to be returned; in this example it is the third character, P. The number 2 specifies that a total of two characters will comprise the new string. Using MID$ you can remove as little or as much of a string as you want and you don't have to start at either end as LEFT$ and RIGHT$ require. The number conversion routine uses MID$ in line 5190 to find QS$, the sign of the exponent.

LEFT$

The LEFT$ function, used in line 5210, returns a fixed number of digits starting at the left side of a string. Consider our example SS$ = APPLE. LEFT$ (SS$,3) would return the three leftmost digits, APP. In the case of line 5210, QL$ equals the first numeral in the value to be converted. We know from Figure 1 that this is the only number before the decimal place. Lines 5230–5290 use the MID$ function to create QM$, those numerals that occur after the decimal point.

At this point the routine has completed its breakdown of the value to be converted. For numbers like 7.E – 06 there is no QM$ since no numerals, other than the exponent, follow the decimal point. Creating standard form numbers is done by piecing together the various strings, along with the necessary zeros to create the final version, QF$.

Adding Zeros

When the standard version of the value is formed, it contains digits to the left of the decimal point if the number is very large or zeros to the right of the decimal point if the number is very small. The choice between these two alternatives is made in line 5310, where the QS$, the sign of the exponent, is checked. Those numbers that require additional zeros to be added to the left of the decimal point are processed in a FOR. . .NEXT loop found in lines 5320–5370. Finally, those numbers that are smaller than .01 receive leading zeros starting at line 5400.

Line 5450 checks to see if the number is negative. If it is, a minus sign is added and the routine returns to the main program with standard notation of the value stored in QF$.

The number conversion subroutine can be incorporated in existing programs; just make sure there are no conflicts in line numbers or variables. (The table lists all the variable names used in the routine.) By storing the routine as a text file you can incorporate it into a program by using the Apple's EXEC command. Before you do any merging, make sure that the number conversion part is debugged.

Listing 2 shows a short program to check the operation of the routine. If you enter values like 7.5E + 25, be prepared to do some zero counting. A number conversion routine is clearly worthwhile for anyone writing software for public consumption, but it is no substitute for many of the advantages offered by scientific notation. ■

MICROTEK
COMPUTER PRODUCTS

IF YOU HAVE A GRAPHICS PRINTER YOU MUST HAVE A GRAPHICS INTERFACE.

DUMPLING-GX
GRAPHICS PRINTER INTERFACE

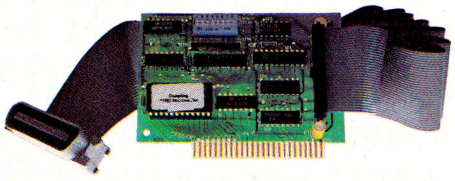

The Dumpling-GX is a DIP Switch Selectable Dual Hi-Resolution Graphics Screen Dump parallel interface card for Apple computers and most popular printers.

At the flick of the DIP switch, The **Dumpling** will interface with: **APPLE ■ EPSON ■ NEC ■ IDS* ■ ANADEX ■ C-ITOH ■ PMC ■ CENTRONICS ■ OKIDATA ■ MANNESMANN TALLEY**

Selectable Strobe and Acknowledge polarities allow use with **any** 8-bit parallel printer in text and block graphics mode.

Microtek's proprietary on-board firmware enables the **Dumpling-GX** to establish intelligent communication between your Apple computer and your printer. Simple commands allow:

- Selection of your printer by DIP switch.
- Selective Dump Page 1, Page 2, or both in either text or graphics mode.
- Chart Recorder Simulation.
- Left & Right Margin Control.
- Line Length/Page Length Selection.
- Block graphics via 8th bit Control.
- Printer bell Control.
- Skip over Perf.
- 90 degree Rotation.
- Double Size Graphics.
- Emphasized Graphics Print.

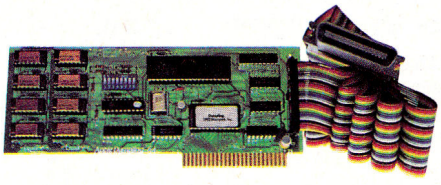

*With special PROM and cable.

DUMPLING-64
GRAPHICS PRINTER SPOOLER

The **Dumpling-64** is the next logical extension to the industry standard Dumpling-GX parallel interface card, allowing the computer to DUMP vast quantities of data into the **Dumpling-64** for later printing, thus freeing up the computer for additional tasks.

The **Dumpling-64** allows full use of all **Dumpling-GX** features. In addition to the standard graphics features, the **Dumpling-64** offers:

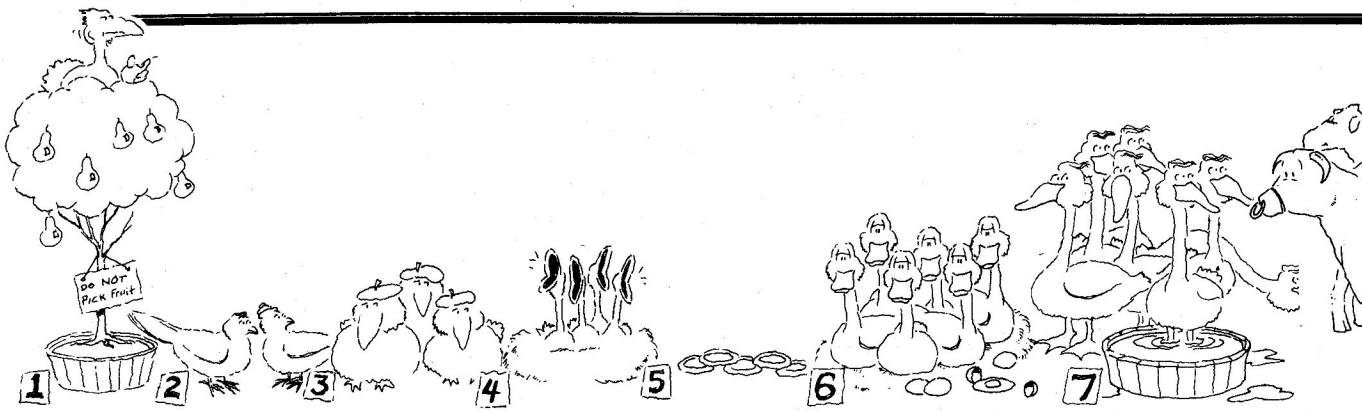

- Buffer sizes from 0 K to 64K. User upgradable.
- Graphics Dumps to Buffer. Page 1 and/or 2.
- Multiple Consecutive Screen Dumps to Buffer.
- Software reset to clear Buffer.
- "Space Compression" saves valuable memory taken up by 'spaces' in text or spread sheets.
- Automatic Buffer Size Recognition.
- Pause while printing-immediate.
- Pause while printing-delayed.
- Resume printing.
- REMOTE pause-immediate: hooks up to telephone, switches—etc.
- Buffer ON/OFF control.
- INSERT text editing capability with Pause and Buffer ON/OFF control.

The 39¢ Printer Stand

Tangible proof that nobody's more tight-fisted than a cornered Yankee!

by George M. Engel

The Lady Arlene had been after me for months to get my box of printer paper off the floor. My standard reply, "Well, it's out of the way there and, besides, where would I put it?" was getting kind of old.

Then one day, with a look of mischievous glee in her eyes, she blissfully informed me that Sheba, our twelve-pound black Burmese cat, had used my nearly empty box of printer paper as a litter pan. Since our three cats talk to the Lady Arlene constantly, is it possible that the Lady Arlene. . . ? Nahh, that's really pushing the imagination.

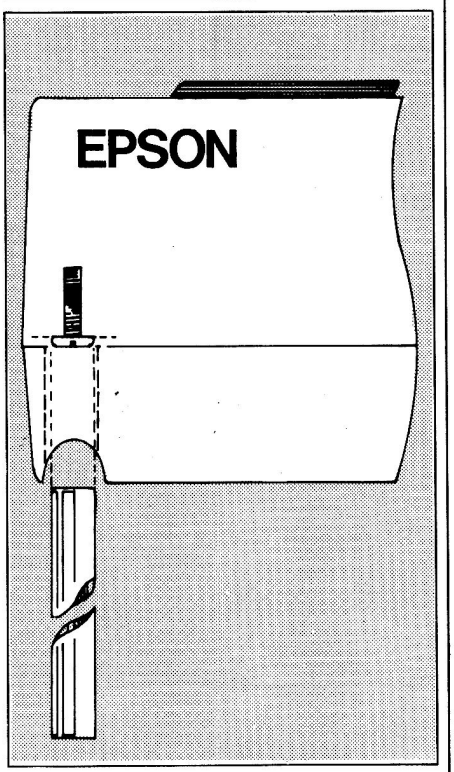

Perusing the Situation

Well, first things first. After kicking the cat, I decided that twenty to thirty dollars was too much to spend on a commercial printer stand. Being frugal by nature, I decided to build my own for as little as possible.

The bottom of the Epson MX-80 printer has four deep holes for screws that hold the top and bottom parts together. Hmmm. . . a quick measurement gave me an idea. All that would be required was a 5/16-inch wooden dowel. Two hardware stores later I was all set.

Construction

After kicking the cat again, I cut the dowel into four identical 6-inch pieces, one to fit in each hole in the printer. Then I slowly sanded approximately one inch around one end of all four pieces. I emphasize slowly because if you sand too much, the dowels will fit loosely and possibly cause vibration while printing. After all the dowels fit properly, I installed them and turned the printer on. It wobbled, so I sanded

the offending leg a little until they were all even.

The Finishing Touch

For a pleasing finish, I stained the legs to match the top of my walnut table. I numbered them and placed corresponding masking tape numbers on the Epson case. Unless you can sand wood with the precision of a Swiss craftsman, they won't fit the same in all the holes. To cap the project and ensure that the dowels won't scratch the table, I put round rubber feet on the bottom. Felt stick-ons would work just as well.

Parting Shot

After a cup of coffee and a kiss on the cheek, the Lady Arlene's parting comment was, "Now if you'd only find some way to take less room with your Apple—say a nice monitor stand. . . ." I locked my computer room door and hurried for my tools. I swear that cat gave me a malevolent grin. With the top cover off, my Apple looks a lot like a litter box. ■

Tally Ho! Keeping Track of High Scores

The better a game-player you are, the more often your high scores change. Preserve those milestones on disk using this handy program.

by Reginald V. Blue

This program is the perfect way to keep high scores on all your favorite computer games. If you are relatively new to programming, the program structure should be useful for adaptation to your own particular programming needs.

- Lines 10–70 are just for the title.
- Lines 80–200 start the program. The routine loads up the data from the text file Game Scores that stores the scores. (Be sure you don't delete this file!) Since this routine needs a file to access, it has an ONERR GOTO routine which, if it can't find the Game Scores file, causes the program to go to line 160 to skip over loading the file. Line 160 creates the dimensioned variables that your program needs. Line 170 protects you from crashing by routing your program around lines 180–190.

After you have entered your game scores into the program and saved all changes to the data file, you will not need this ONERR GOTO routine, since there will be a game scores data file to read. Notice that line 100 is used to define your data file name. Obviously any name could be used here in conjunction with lines 130, 140 and 200.

- Lines 150 and 160 give you flexibility in how data is stored in the data file. Using z as the first data output of your

Some Very Good Reasons to Buy an Echo Speech Synthesizer.

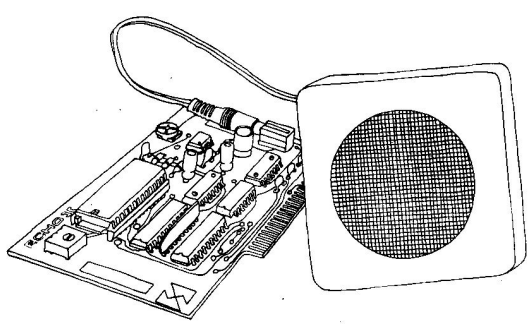

We're confident we have the most intelligible, versatile, and economical speech synthesizer on the market. Once you hear it, we're sure you'll be convinced too. All ECHOs are capable of speaking in four different voice modes which range from a robotic machine voice to natural female speech. (The fixed speech and custom modes are optional.)

It's Easy To Use

Unlike other speech systems, the ECHOs are very simple to use. It only takes a minute or two to get the ECHO talking. Any text which can be printed to the screen can be spoken. If you've written a BASIC program you can add speech with simple modifications.

Software Compatibility

Not only can you add speech to the programs you write yourself, over 25 top educational and adventure software manufacturers are currently designing programs to be compatible with the ECHO II. Be watching for details.

Value

Each ECHO comes ready to use with a speaker and tutorial-style manual. The ECHO II, priced at $149.95, also comes with a variety of demonstration and utility programs. The new ECHO GP (General Purpose), priced at $199.95 is a stand-alone unit with its own on-board microprocessor; it will interface with any computer through the serial port. All ECHOs have a two year warranty.

Bells And Whistles

If you want bells, whistles, music and sound effects, plus state-of-the-art sprite graphics capabilities, the ECHO technology is available on Synetix Systems' new Supersprite Board.

Check It Out

Most Apple dealers have the ECHO II available for demonstration as part of Street Electronics/ Orange Micro's unique Grappler+™, Bufferboard™, ECHO II™ Talking Demonstration.

POWERTEXT.
The Word Processing System For Professionals.

All across the nation, PowerText has become the prime word processing system for professionals.

Businesspeople. Writers. Attorneys. Educators. Men and women who demand a level of performance not available from the mass-market word processors.

If you require a true high-performance system, consider PowerText.

Formatting is fully automatic.

PowerText prints the most complex documents—from business letters to dramatic scripts to legal documents packed with footnotes—precisely consistent with the formats you define. You need never worry about printed style as you write. Yet you always get perfectly formatted documents.

It's almost like dictating to your computer.

When you prepare outlines, questionnaires, and reports, PowerText can automatically indent and assign numbers to your paragraphs (Roman or Arabic numerals, or alphanumerics, as you direct.)

There's a full complement of editing features. Including "nested" editing, equivalent to split-screen editing.

You get built-in form letter capability.

Remarkably versatile columnar capabilities.

User-definable function keys.

And far more.

Yet for all its power and sophistication, PowerText is remarkably easy to learn and operate. The system includes an excellent 10-lesson tutorial and a reference manual.

We'll send you complete details.

It is impossible to describe all of PowerText's many valuable features here. But we'll be pleased to send you detailed information, including many samples of actual PowerText output.

Just write us a note, or phone us.

(Or you may wish to send for the tutorial and manual. The cost is $25. Please indicate which computer you have.)

MICRO PROGRAM DESIGNS
5440 CRESTLINE ROAD
WILMINGTON, DE 19808

"The total data storage in your data file is limited only by your available memory."

ly have in your data file by 20 more game names and scores. If at any time you exceed this 20, your program creates an error, which routes you back to the menu. The total data storage in your data file is limited only by your available memory.

- Lines 220–400 are your main menu section of the program. These lines offer program options. A useful programming concept occurs at line 380. The GET Y$ command is used for speedy program option selections. If a GET A command were used here and a letter were accidentally pressed, your program would crash. But when using a GET Y$ command, any key except reset may be safely input. Y$ is then safely translated into a number by the expression A = VAL (Y$).
- Line 390 assures you that a legitimate option has been selected. The options are routed to the correct locations in memory at line 400.
- Program option <1>. Get High Scores displays your current game data status and the top two scores with the scorers' names. Lines 410–530 are responsible for this.
- Program option <2>. Input New High Scores is set up at lines 540–770.

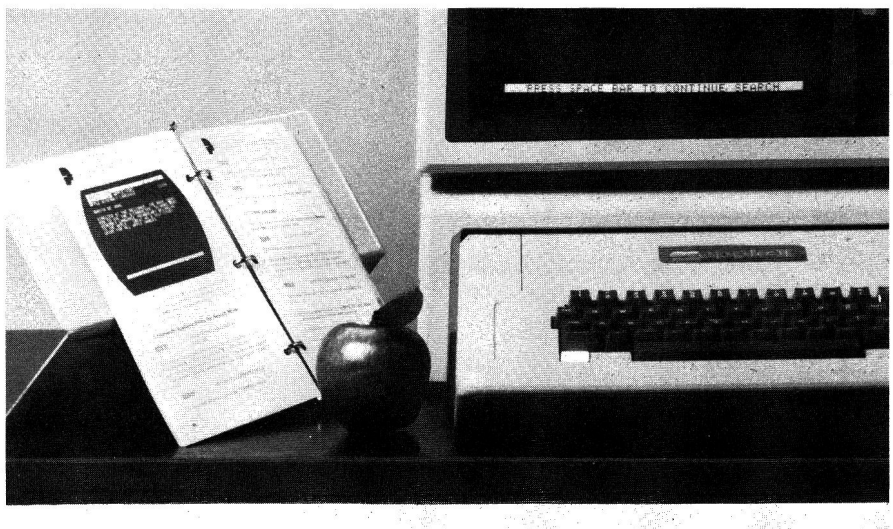

A$ (N)—game names
HS (N)—highest game score
P1$ (N)—name of high scorer
LS (N)—second highest score
P2$ (n)—name of second highest scorer

- Lines 720–740 allow automatic stacking of game scores into their relative positions.
- Program option <3>. Input New Game is accomplished by lines 900–930. Remember, never input more than 20 new games.
- Program option <4>. Save All Changes To Data File is the most important option. After you have input all new games and scores and alphabetized your data you must use this program sequence (lines 780–890) to store the data to your disk for future retrieval.
- Program option <5>. Alphabetize Games (lines 940–1080) allows you to put your games in correct alphabetical order for easy reference.
- Program option <6>. Printer On For Print Out (lines 1090–1150) turns the printer on to print your high scores. However, the routine starts to print immediately after being set, so have your printer ready! ■

GIVE YOUR APPLE® INSTANT RECALL™ FOR JUST $59.95

SAMS BOOKS™

Forget what you've heard about computer filing. INSTANT RECALL just made everything easy. No fields, no forms, no formats, no fooling. Nothing to set up before you get started. And, best of all, INSTANT RECALL comes at a no-kidding price of just $59.95.

Save your notes about everything. Keep track of appointments and important dates. Record minutes of your meetings. Or reminders about customers conferences, expenses, or just about anything! You can mix up as many kinds of information as you want, or you can organize different files on different diskettes. Either way, INSTANT RECALL finds what you've filed the instant you ask, whether or not *you* remember what's there.

If you've got an Apple II® or Apple II Plus® with at least 48K, one disk drive and Applesoft in ROM, what are you waiting for? To find your nearest dealer or to order, call 800-428-3696 or 317-298-5566 and ask for Operator 434. In Canada, contact Lenbrook Electronics, Markham, Ontario L3R 1H2.

The Graphic Solution

Do you have a restless imagination? Become your own "movie" producer with this lo-res/hi-res graphics package from Accent Software.

by Hartley G. Lesser

The Graphic Solution comes in a three-ring binder with 179 pages of well-written documentation and two double-sided disks. The manual introduces TGS, and then offers to transform the purchaser into a movie director of sorts. The "actors" you direct are bit-mapped shapes constructed through simple keyboard commands, and the program's editor and "projector" let you create the "movie film."

You build your shapes on the lo-res screen, which offers a magnified view of the shape creation, then transfers them to the hi-res screen for further refinements and animation.

Your shapes are dropped and saved in windows that are moved about the screen. These saved shapes are called frames, and several frames make the movie. Once the movie, or sequence, has been saved to disk, you can use it in your own applications through use of the projector module.

The tutorial applies a hands-on approach to learning the system. After running the demo program, you'll find it's time to dig right in. I used an Apple IIe for my investigation, and discovered that TGS does not recognize its cursor control keys. Also, to obtain the character, you have to press shift-6 instead of shift-N.

Tips for Beginners

The TGS program disk should never remain in the disk drive, even though the chances of ruining it are slight. An initialized storage disk is kept in Drive 1 after the main program has been loaded into memory. This is limiting, in that files maintained on a separate disk can't be accessed through Drive 2. You're tied into using only one drive with TGS.

The TGS menu appears on screen as shown in Table 1.

Type in the appropriate number, and the program loads the module. Item 1, LOAD SEQUENCE, loads into memory any graphic sequence that you've saved to disk, and 2 sets up a new sequence. Item 3 saves the newly created sequence on disk. Items 4 and 5 deal with saving the current hi-res picture as a background, and 6 accesses a handy module that enables you to draw perfect circles in any sequence or background. Item 8 gives you a list of all files on your disk, while 9 allows you to erase any files you no longer wish to keep. Quit is fairly obvious.

When you are processing lines, circles, text and backgrounds in the hi-res mode, information at the bottom of the screen tells you the specifics of your drawing (see Table 2).

By examining these tables, you can tell immediately what frame number is currently being worked on, the shape number involved, the amount of time the frame is being "exposed," and how much room is left in the shape table for additional shapes.

The SHOW mode is actually the built-in projector of TGS, and it is here that you watch whatever you've filmed come to life through animation. The LINE mode lets you draw long lines, rectangles or other creations too large to be drawn on the hi-res screen. TEXT mode allows you to place text anywhere on the screen, and also is considered a graphic element—which means text can be animated. You can obtain the CIRCLE mode only by accessing the program disk; CIRCLE is one of the least-used modules, and memo-

"No, we're all okay, but our computer's gone."

It could have been a lot worse.

Luckily, all that was missing was the computer and some spreadsheet software. And that should be covered by insurance.

But it isn't. Ed didn't realize that once he started using his home computer on business projects, his homeowners insurance no longer would cover it.

As suddenly as the robbery had occurred, Ed found himself out several thousand dollars with no way to recover it.

You need SAFEWARE™

If you use your microcomputer for business, you can protect yourself from a loss like this with SAFEWARE. For as little as $35 a year, SAFEWARE insurance covers all hardware, media and purchased software. Both business and personal.

SAFEWARE protects against theft, fire, accidental damage, even the destruction caused by power surges.

And, now, SAFEWARE is available on a 10-day trial basis. If you are not completely satisfied with the coverage provided, return the policy within 10 days for a full refund.

The only risk you take with SAFEWARE is not having it.

To obtain more information, or bind coverage immediately, call the toll free number. Or send the coupon to: Columbia National General Agency, 88 E. Broad St., Columbus, Ohio 43215 (In Ohio call toll free 1-800-848-2112).

1-800-848-3469

ry is saved by placing this module elsewhere.

Access the hi-res screen from lo-res simply by pressing the letter H. A window appears and may be moved anywhere on the hi-res screen. By typing P you can drop whatever was drawn in the lo-res mode inside the window of the hi-res screen.

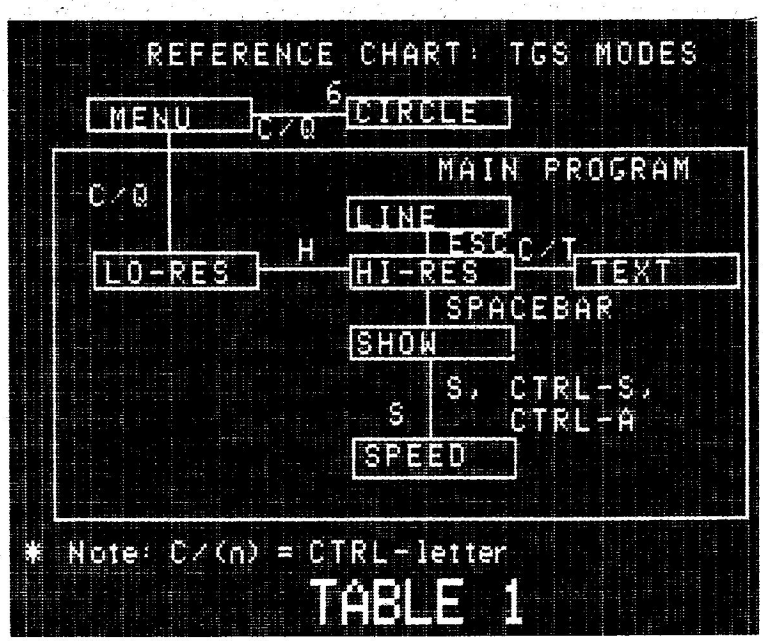

One of the most powerful capabilities of TGS is the macro command. This lets you define a repetitive task as a macro, so that a single key press will duplicate whatever steps were necessary to define the original task. For example, suppose you've drawn a square in the lo-res mode, and have dropped it inside the hi-res window. You want a nice string of squares that lead up and to the right of the hi-res screen. The normal commands to accomplish this task would be:

D—window moves to the right
W—window moves up
O—non-destruct copy of the lo-res screen (where the square is)

You can take a shortcut by creating a macro. Press control-R to start the macro, enter the commands, and press control-R again to end the macro definition. Then every time you press R, the entire command sequence executes. A macro can consist of as many as 255 key commands!

It's easy to transfer a shape from your hi-res screen into lo-res. Just position the hi-res window over the shape, and press the letter I. The hi-res shape is now magnified in lo-res, and this is where you can edit the shape to whatever definition you wish. In lo-res, gray lines at the left and right edge of the screen remind you of the area that falls outside of the hi-res window.

Once the hi-res shape is in lo-res, remove lines by positioning the cursor at any location in the RETAIN mode, then enter ERASE mode by pressing the space bar once. Cursor movement over the drawing will erase the areas specified.

Lesson 2 of the TGS tutorial requests the user to think of the screen as a camera. When the + key is pressed, a picture has been taken of the hi-res window. The picture, this shape, is added to the shape table currently in memory. Move the window anywhere on the screen and, by pressing the semicolon key, plot the current shape at its new location.

Animation

Create the first frame by using the control-Z command. Each time you access this dual keypress, the shape plotted at the current window location (as indicated by the SHAPES number information) becomes the next film frame, with an EXPOSE value (length of time shown on the screen) equal to the TIME information. By combining these keypresses into a macro, the movies build rapidly.

Inspect the entire movie or individual frames in the SHOW mode by pressing either a right or left arrow key. This halts the show, and allows you to scroll the frames of your movie. Also, you can tag a frame by pressing control-K, which displays that particular frame number in inverse video at the bottom of the screen. Tagging a frame allows you to change its exposure speed at some future time. TGS easily locates a tagged frame when you press the letter K in SHOW mode. The longer the exposure, the slower the overall movement of the movie.

You can elongate and compress shapes while in lo-res mode, and scroll the entire hi-res screen. You can also make mirror images of created shapes and add shapes to a completed shape table without disturbing its contents. Spot animation, the changing of a shape's aspect while it's inside a static window, reveals how effective and simple it is to obtain shape motion without involved programming. Combined commands built into the macro capability give extremely smooth animation. An even better way to obtain flicker-free animation, a method that requires no new shape creation at all,

FRAME 0/0	ROOM 14283	
SHAPE 0/0	MODE TABLE	HI 126 65
EXPOSE 80	SHIFT 0

Circle 362 on Reader Service card.

involves shifting the screen itself; the window changes position automatically as the shape moves toward a particular location.

One of the idiosyncrasies of the Apple hi-res screen is its handling of color. When a color-filled shape is moved, the color may change. This is due to the two color sets (green/purple and red/blue) peculiar to the Apple. Using color effectively in hi-res graphics demands an understanding of this quirk. You'll find help in the TGS manual.

You may insert different shapes into the film, or substitute shapes for each other, bringing different combinations of shapes into existing frames, and modifying the projected sequence to reveal new animation. This shape substitution is a powerful tool, and the sky's the limit in using this application. You may easily delete a frame, as well, while the other frames automatically adjust themselves correctly to fill the vacancy.

Multiple shape animation is also possible; dual shape animation along parallel paths creates the illusion of simultaneous movement. The effect is impressive.

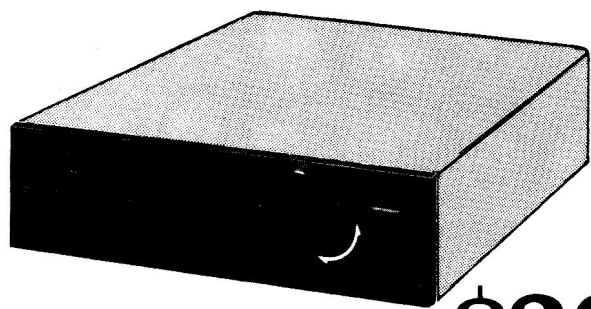

The projector itself is a most necessary and integral part of TGS's success. The Sequences disk contains a program illustrating the projector's features. This section of the documentation, though not impenetrable, may be the hardest to grasp.

For straight film showings, you needn't know how to program. But for sophisticated applications, a knowledge of Basic is absolutely necessary, as a controller program must be written to use the projector in your own applications. Some help is provided in the manual. Appendix A reveals the memory locations of the TGS text file, the TGS sequences, the projector, controller variables, the hi-res screen and the controller program. The final reference section lists all of the commands used by TGS.

TGS is a well-programmed graphics package—superior when dealing with animation, far above standard for shape creation, but below average when dealing with background creation. Except for one documentation error on page 60 (CTRL-A should be CTRL-Z), the tutorials are written exceptionally well. There is little doubt in my mind that the capabilities of TGS justify the price of $149.95. Accent Software, 3750 Wright Place, Palo Alto, CA 94306. ■

Softlights

Child's Play I is the new learning tool for preschoolers written by Mike Taylor. It's designed to help youngsters learn the concepts, bigger than, smaller than, and different from. It also teaches numbers and counting.

Additionally it has a series of five mazes with Artie the Ant. The child guides Artie through the maze to a sugar crystal where the child is then awarded with a short song.

There is also a short drawing program. Paddles are required for all of the activities. Some parent intervention is required for very young children.

This disk is packed full and is a bargain at **$19.99.** Dealer information available (209) 992-3600.

A Soft Switch for MBasic

by Paul M. Danzer

I normally do my home programming in MBasic, which comes with the Microsoft/Softcard Z-80 processor installed in an Apple II Plus. This lets me take advantage of the editing built into the Softcard CP/M system, and fends off friends who want me to stick with Applesoft.

Recently I finished a program using 20 PRINT statements to display results on my 9-inch monitor. I realized then that I'd have trouble printing the results on my printer.

Applesoft accepts the command PR#1, used as a soft switch to route output to a printer; the corresponding PR#0 command returns output to the screen. MBasic, however, does not make such provisions.

Therefore, I was faced with reformatting all 20 PRINT statements as LPRINT, as well as conceding defeat to my pro-Applesoft friends. Curses!

Being very lazy when it comes to typing (as well as a poor loser), I took a second look at IOBYTE, tucked away by CP/M at hex location 0003. You can find IOBYTE's description in the CP/M manual section devoted to masochists who insist on using nonstandard input and output devices.

IOBYTE consists of eight digital bits, whose lowest two control the CONSOLE function. These two bits are normally set to a zero-one pattern, establishing the keyboard as input and the monitor as output. According to the manual, reversing this pattern makes the printer or LST device become the output.

"I was faced with reformatting all 20 PRINT statements as LPRINT, as well as conceding defeat to my pro-Applesoft friends. Curses!"

A quick PEEK at this location (0003) reveals a preset value of decimal 149 loaded by the CP/M master disk. Entering a command of POKE &H0003,150 adds the +1 needed to change the output routing from the monitor to the printer.

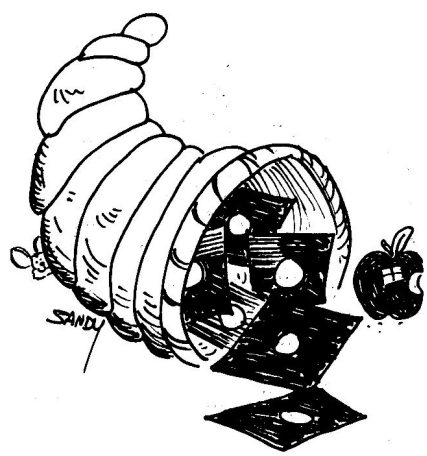

The Listing demonstrates my idea. If A$ is not entered as Y (for Yes), the letters A, B, and C are printed on the monitor, and location 0003 is poked to a value of 149. Since 0003 already was set to 149, nothing is changed and the program loops back to the start. However, if A$ is entered as Y, then 0003 is poked one decimal higher, routing the output to the printer, and the POKE command following the last PRINT statement resets the output to the monitor.

Note that depending on your printer and printer interface card, TAB and HTAB don't always appear the same on the printer and screen—so choose formats that yield more consistent results.

Now my version of MBasic includes the equivalent of PR#1 and PR#0, and my Applesoft friends have one less thing to tease me about. ■

```
10 REM ** THIS IS LISTING 1
20 REM ** THE PROGRAM TESTS THE USE OF
30 REM ** POKE TO SWITCH OUTPUT BETWEEN
40 REM ** THE MONITOR AND PRINTER
50 REM
60 REM
70 PRINT "DO YOU WANT HARD COPY? "
80 GET A$
90 IF A$="Y" THEN POKE &H3,150:REM SELECTS PRINTER
95 IF A$="S" THEN END:REM KILLS LOOP,RET TO MBASIC
100 PRINT "A"
110 PRINT "B"
120 PRINT "C"
130 POKE &H3,149:REM RESETS OUTPUT TO MONITOR
140 GOTO 70
```

Program listing. Soft Switch for MBasic.

You can write to Paul M. Danzer at 2 Dawn Road, Norwalk, CT 06851.

Program Loader

by Jeffrey A. Mills

In a blaze of laser fire, you attack the enemy! Your screen dissolves to a mass of random lines as the end of your program mysteriously disappears! If you have ever experienced this frustrating scene you will be pleased to know that you are not alone.

The Problem

Apple II's hi-res graphics pages reside in the middle of memory, at locations $2000–$3FFF (8192–16383) and $4000–$5FFF (16384–24575). As your program and variable storage grow, they may occupy space in memory reserved for hi-res one and hi-res two. Then when HGR or HGR2 is called—poof!—no program!

After several weeks of trial and error program splitting with my new space game, I decided to attack my reference library and do battle with Apple's memory instead of the aliens.

The Solution

The Apple II stores your program in memory starting at location $800 (2048). Your program's variables are then stored, as they are initialized, between the end of the program (LOMEM) and the end of usable memory (HIMEM). You can gain the use of memory from $2000–$3FFF (8192–16383) by using HGR2 instead of HGR. This doesn't, however, allow you to flip between the two graphics pages to create smooth animation or use the four-line text window.

Not finding this to be a viable option, I searched on. The Apple II keeps, in memory, the locations where it will load the program and store the variables. Those locations are listed in Table 1.

While attempting to decipher those pointers, I realized that changing them could trick the Apple II into relocating the program and variable storage to make better use of the total memory.

By loading the program above the graphics area, from $6000 (24576), you can free up the area from $800 (2048) to $1FFF (8191), which can then be used for variable storage. This arrangement will go completely unnoticed to you as your program runs. Tables 2 and 3 list the pokes necessary to accomplish this.

Although this series of pokes worked, it was not convenient. It also did not allow my programs to run without first performing the series of needed pokes.

To solve this, I've written a combination program/exec file (self-generating) that will do it all for you! The program is titled Program Loader and the text file is called Loader. Both programs are written in Applesoft Basic for an Apple II with 48K.

What It Does

Program Loader inputs the name of the program you want to relocate and whether you want it above hi-res one or hi-res two. It then executes the text file, Loader, which will perform

Letter Quality Printer by DTC
Print speeds up to 32 CPS, 48K buffer, proportional spacing, Diablo 1640/1650/630 compatible protocol. Comes with printwheel, ribbon and users manual. Serial, parallel, and IEEE 488 interfaces standard.

PRD-11300 *380Z printer* — **$1295.00**
PRA-11000 *Tractor option* — **$169.95**
PRA-12000 *Cut Sheet Feeder* — **$699.95**
CABLE *Please specify* — **$50.00**

NEW! Daisywheel from SILVER REED
200 words per minute, full 15-inch platten, Diablo 630 protocol, 10, 12, 15 pitch or proportional spacing, logic seeking bi-directional printing, very quiet - very reliable. Best letter quality printer under $1000.00!!

PRD-52001 *Parallel* — **$699.95**
PRD-52002 *Serial* — **$699.95**
PRA-52000 *Adjustable Tractor* — **$129.95**

NEW! Okidata 92 & 93
160 CPS standard printing, correspondence quality printing,dot-addressable Graphics, and alternate downline loadable character sets.

PRM-43092 *ML92 parallel* — **CALL**
PRM-43192 *ML92 serial* — **CALL**
PRM-43093 *ML93 parallel* — **CALL**
PRM-43193 *ML93 serial* — **CALL**
PRA-43092 *ML92 tractor* — **CALI**

Gemini Printers by Star Micronics
Economically priced, high quality, Epson-compatible 120 CPS, 9 x 9 dot matrix, friction & tractor feed, bit image Graphics

PRM-66010 *Gemini 10X (10" carriage)* — **$329.95**
PRM-66015 *Gemini 15 (15" carriage)* — **$529.95**
PRA-66200 *Gemini serial board* — **$85.00**

Printer Interface Card & Cable for Apple II
Interfaces any Centronics parallel to Apple II/+/e. With Cable

IOP-2100A *Printer Link* — **$49.95**

Microbuffers by Practical Peripherals
Available in Epson, Apple, and in-line versions both serial and parallel.

IOP-2510A *Inline, 64K parallel* — **$339.95**
IOP-2530A *Inline, 64K serial* — **$339.95**
IOP-2540A *Epson parallel 16K* — **$159.95**
IOP-2550A *Epson serial 8K* — **$159.95**
IOP-2570A *Apple parallel 32K* — **$289.95**
IOP-2590A *Apple serial 32K* — **$289.95**

Grappler Plus by Orange Micro
Latest version of the popular Apple parallel printer interface with Graphics.

IOP-2300A *Grappler+* — **$139.95**

NEW! CP/M® 3.0 PLUS Card for Apple by ALS
The most powerful CP/M card available 6MHz Z-80B, additional 64K of RAM, Graphics, full CP/M 2.2 compatibility.

CPX-62810A — **$359.95**

ALS Z-Card for Apple II
Z-Card with CP/M 2.2, like Softcard

CPX-62800A — **$149.95**

16K RAM Card for Apple II
Expand your Apple II to 64K, use as language card, full one year warranty.

MEX-16700A *Save up to $100* — **$49.95**

80 Column Card — Micromax
80 column x 25 line video board for Apple II or II+. 7 x 9 matrix characters with true descenders, shift key selectable upper and lower case, inverse video, 40/80 column operation switchable from keyboard. DOS, Pascal, and CP/M compatible.

IOV-2500A *Viewmax-80* — **$149.95**
IOV-2455A *Pre-boot disk for above* — **$29.95**

Video Monitors by USI International
The "Cadillac" of video monitors. 20MHz video bandwidth, 1000 lines resolution.

VDM-740920 *9" Green* — **$129.95**
VDM-740910 *9" Amber* — **$149.95**
VDM-741220 *12" Green* — **$159.95**
VDM-741210 *12" Amber* — **$179.95**

Video Monitors - Best Buy
20 MHz, 1000 lines resolution. We have priced these so low the manufacturer will not let us advertise their name!

VDM-750920 *9" Green* — **$99.95**
VDM-750910 *9" Amber* — **$129.95**
VDM-750910 *12" Green* — **$129.95**
VDM-751210 *12" Amber* — **$139.95**

Taxan RGB Color Monitors
18 MHz, choice of medium or super hi-res

VDC-821210 *RGB Vision-1* — **$399.95**
VDC-821230 *RGB Vision-III* — **$699.95**
VDA-821200 *RGB card & cable* — **$129.95**
VDA-821220 *Apple III cable* — **$19.95**

Zenith Hi-Res 12" Green
15 MHz. switchable 40 or 80 columns.

VDM-201201 *List price $189.95* — **$114.95**

Kraft Systems Joystick
Dual mode - spring return or free floating, full one-year warranty.

SYA-1513A *Apple joystick* — **$59.95**

Disk Drive for Apple
All the capabilities of the Apple brand drives at a fraction of the cost. Totally DOS, Pascal and CP/M compatible.

MSM-431010 *Drive with cable* — **$229.95**
MSM-431030 *Controller* — **$59.95**
MSM-571010 *Half height Teac* — **$299.95**

Vista V1200 6 Megabyte Subsystem
Lowest priced 6 Megabyte system for Apple; uses a floppy cartridge, allowing you to keep duplicates of your valuable data. Accesses as fast as a Winchester. CP/M, Pascal, DOS patches included.

MSM-351200 *V1200 w/controller* — **$1295.00**

Vista Quartet
Dual low profile slimline 5¼" drives give you the capacity of 4 standard Apple floppies. Boots and runs all Apple software. With controller

MSM-354000 — **$699.00**

Super Diskette Bargain
From a major manufacturer, now available at a new low price. Single sided, certified double density, packaged in a durable plastic library case; perfect for Apple. Price is good only while our supply lasts!

MMD-5121003 *Box of ten* — **$18.50**

Verbatim Optima© Diskettes
These are the absolute ultimate in quality, there are none better! Packaged in versatile Disk Bank storage boxes. 5¼" *SS DD soft sector w/hub rings. (boxes of 10 only)*

MMD-5120102 — **$67.95**

Plexiglass Disk Tub
Convenient storage for up to 75 diskettes.

MMA-505 *5¼" Disk Tub* — **$19.95**

System Saver Fan
Cooling fan, surge suppressor, and dual switched outlets; clips onto the side of your Apple II/+/e

SYA-1520A — **$79.95**

Transpak by SSM
Full feature communication software packages with either 300 or 1200 baud modem. Also includes free or reduced-fee introductory packages for The Source, Dow Jones, and Dialog.

IOM-2431A *Transpak 1, 300 baud* — **$388.00**
IOM-2432A *Transpak 2, 300 baud* — **$448.00**
IOM-2433A *Transpak 3, 300 baud* — **$695.00**
IOD-2442A *Transpak 2+, 1200 baud* — **$995.00**
IOM-2443a *Transpak 3+, 1200 baud* — **$1095.00**
IOM-2430A *300b ModemCard* — **$299.95**

73/74	115/116	HIMEM

Note: The memory location preceding the start of the program must contain a zero (0).

Table 1. Memory locations.

the needed POKE commands and then run your program.

How It Works

- Lines 10–250 are the titles and instructions for the program.
- Lines 260–330 run Program Loader or save itself and create Loader on the disk currently in the drive. This is needed because the program, the text file and the program to be relocated must be on the same disk. The save/create is done in a subroutine numbered 1000–1220.

Above Hi-res 1	Above Hi-res 2
POKE 103,1	POKE 103,1
POKE 104,64	POKE 104,96
POKE 16384,0	POKE 24576,0

Table 2. Pokes needed to relocate program.

- Lines 340–380 input the name of the program to be relocated. This is done from a program, since INPUT and GET do not work from immediate mode or from an exec file.
- Lines 390–460 GET the location in memory where you want to relocate your specified program.
- Line 460 executes the text file that performs all of the pokes, and runs the program you specified.

Changes

After you run Program Loader and it executes Loader, you cannot make any changes to the program. Your system will lock up due to the fact that HIMEM is below the end of the program.

To make changes you must turn off the computer, turn it back on in order to reset all the values you have changed, load the program in as usual, make your changes, then relocate it again to run it.

If you are using a shape table, it may be loaded at the end of the relocated program by adding the following lines to your program.

```
10 CD$ = CHR$(13) + CHR$(4)
20 PRINT CD$; "BLOAD 'shape table name',
   A"; (PEEK(176)*256 + PEEK(175) + 1)
30 POKE 232, (PEEK(175) + 1):POKE
   233,(PEEK(176))
```

Program Loader makes it easy to write long programs that move from section to section smoothly. Don't hesitate any longer—make your programs grow! ■

NEW FOR APPLE II AND IIe

WILDCARD™

MAKES BACK-UP COPIES OF PROTECTED SOFTWARE QUICKLY, EASILY, WITH JUST A PUSH OF A BUTTON.

New software locking schemes have rendered even the latest generation of copy programs virtually unusable. Locksmith™, Nibbles Away™ and other "Nibble copiers" require complicated parameter settings, much patience and great effort to use. More often than not, the results are disappointing. WILDCARD is different. Rather than copying disks track by track, WILDCARD ignores the disk and any copy protection encrypted on it. Instead, WILDCARD takes a snapshot of memory in your Apple® II.

Now you can make back-up copies of protected software with the push of a button.

Software is not copy protected. System requirements: Apple II Plus with 64K and DOS 3.3 or Apple *IIe*. Franklin Ace also supported.
*Wildcard does not operate with CP/M® or other microprocessor based software.

FEATURES

- □ Hardware copying device... push button operation.
- □ Copies 48K memory resident software, most 64K software.
- □ No programming experience or parameters necessary.
- □ Backs up DOS 3.2 and DOS 3.3 disks.
- □ Creates DOS 3.3 unprotected and autobooting disks.
- □ WILDCARD lives in any slot. Undetectable by software.
- □ Produces autobooting disk in 2 minutes.
- □ Copies are DOS 3.3 compatible.
- □ Copies become accessible for alterations.
- □ Simple, easy-to-use software included.

WILDCARD ***Utility Disk 1*** also included, featuring:

- □ Automatic program compression and BRUN file maker.
- □ Multiple programs can be placed on the same disk.
- □ Recreates basic files to load and save.
- □ Files can be placed on a hard disk...and more.

WILDCARD $139.95

Order direct from East Side Software Co., 344 E. 63 St., Suite 14-A, New York City 10021, 212-355-2860. Please include $3.00 for shipping and handling. Orders outside continental U.S. please add $10.00 for shipping and handling. Mail and phone orders may be charged to MasterCard and VISA.
N.Y. State residents add sales tax.
Dealer inquiries welcome.

IMPORTANT NOTICE: The WILDCARD is offered for the purpose of enabling you to make archival copies only. Under the Copyright Law you, as the owner of a copy of a computer program, are entitled to make a new copy for archival purposes only and the WILDCARD will enable you to do so. The WILDCARD is offered for no other purpose and you are not permitted to utilize it for any other use, other than that specified.

Zip-Lock Program

by Brent Billock

I read and greatly appreciated Harry White's article on software protection, "The Apple Combination Lock" (*inCider*, April '83). I came up with a method of my own while working on a program with an optional restart, but it can be easily adapted to any other use. It may not be foolproof, but it should be pretty discouraging.

The listing is as follows:

```
5000 PRINT "WOULD YOU LIKE TO
     TRY AGAIN?"
5010 GET A$
5020 IF A$ = "Y" THEN 1
5030 PRINT "OK"
5040 INPUT "]";A$
5050 IF A$ = "LIST" THEN 5070
5060 PRINT "PLEASE RETYPE THAT":
     END
5070 PRINT CHR$(7)
5080 PRINT "?SYNTAX ERROR"
5090 GOTO 5040
```

When the user attempts to list, this method generates output exactly like they would get if they typed in nonsense. ■

Programming Proper Printouts

by Mark J. Yannone

The answer took 14 hours and five pounds of printer paper. The question was, "How can I write a program in Applesoft Basic to finish a printout by advancing the paper precisely to the next perforation (top of form), turn off the output to the printer and continue output to the CRT?"

```
1   REM  THIS SHORT PROGRAM DEMONS
     TRATES A LINE OF PRINT, A FO
     RM-FEED TO THE TOP OF THE NE
     XT PAGE, AND A PRINTER DISCO
     NNECT.
5   HOME
10  D$ =  CHR$ (4)
12  PRINT "DO YOU WANT A PRINTOUT
     ?": GET A$
13  IF A$ = "N" THEN  END
14  PRINT "TURN PRINTER ON AND PR
     ESS (RETURN)": GET A$
15  PRINT : PRINT D$;"PR#1"
20  PRINT "THIS IS A TEST."
30  PRINT  CHR$ (12);: REM  THIS
     LAST SEMI-COLON ALLOWS A FOR
     M FEED TO THE TOP OF FORM -
     AND NO FURTHER.

      PR# NON-DOS INSTRUCTION DIS
     CONNECTS DOS.
40  FOR A = 1 TO 6500: NEXT
50  PRINT "THE TEST IS OVER.  TO
     TEST IF THE PRINTER HAS BEEN
      'TURNED OFF,' TYPE (RUN)."
60  REM  THE THREE COMMANDS ON LI
     NES 30 AND 35 ARE THE KEYS T
     O PROPER END-OF-PAGE/TOP-OF-
     FORM OPERATION
```

Listing 1. Success.

The obvious answer seemed to be something like this:

```
PRINT CHR$(12): PRINT D$;"PR#0"
```

Wrong! No such luck.

The result of this statement was an additional line feed past the top of form. The culprit was the colon that followed PRINT CHR$(12). Realizing that, the next logical attempt was to insert a semicolon after the top-of-form command to avoid the line feed. The statement then read:

```
PRINT CHR$(12);:PRINT D$;"PR#0"
```

> **"Other print statements followed, and they, alas, went to the printer, too."**

Success! Almost.

If this had been the last statement of the program, all would have been well. As it was, other print statements followed, and they, alas, went to the printer, too. This time, the semicolon was the culprit, since it had the effect of concatenating the two commands. Apparently the DOS command PRINT D$;"PR#0" does not work if it is concatenated. On the one hand, I needed the semicolon to prevent an unwanted line feed, and on the other, the semicolon caused a vital command to be ignored. What to do?

That's where the hours and hours and rivers and rivers of paper came in. I tried dozens of combinations of these two commands with dummy print commands, double commands and the non-DOS command PR#0. I even tried to reprogram the printer to print a 65-line page rather than a

Address correspondence to Mark J. Yannone, 2202 N. Laurel Ave., Phoenix, AZ 85007.

66-line page to compensate for that inevitable extra line feed at the end. Again, no luck. Either I would get the extra line feed, or the printer would not stop printing, or the system would hang, or two of the above or all of the above. By this time, 12 hours of frustration had elapsed.

```

```

Listing 2. Typical Failure.

My next move was to study the *Apple II DOS Manual* (for the umpteenth time) to seek out a clue to what had been happening. And there it was—buried in the middle of page 105—the answer to the problem. Plain old PR#0 was the command to use, but since this partially disconnected DOS, the operating system had to be reconnected somehow. This can be accomplished by inserting the command CALL 1002 immediately after PR#0. I tried it and it worked beautifully. The paper advanced to the top of the next page and output was shunted exclusively to the CRT. What a relief!

See Listing 1 and 2, Success and Typical Failure, for illustrations of correct and incorrect programming for the printer. And I wish you more productive days than I had today! ■

EDX/AB

At Last! A Full Screen Editor for Applesoft!

■ **EDX/AB** is not to be confused with Applesoft *line* editors where each line to be edited must be individually called up. It is a full screen editor that lets you insert, change or delete anywhere on the screen.

■ **EDX/AB** lets you scroll through your program in both directions. That's right! It lets you scroll both forward and backward, continuously or one line at a time.

■ **EDX/AB** is controlled by the top row of keys on the keyboard, which serve as pseudo-function keys. A graphic symbol for each function is printed on a detachable strip.

■ **EDX/AB** is written completely in machine language. It requires Apple II with 48K, Applesoft in ROM, 1 or 2 drives, DOS 3.3.

Yes, please send EDX/AB at $59.95, plus $2.50 for shipping and handling.

Bent on Business

by Gregory R. Glau

Avoid a Random Mess

I was on the phone to Bob at ComputerLand about five minutes after it happened. "There's something wrong with my Apple," I told him. "This darn computer is losing data all over the place and I'm bringing it in this afternoon and you've got to fix it because I've got payroll to do in the morning and this thing's gotta work—"

When he finally calmed me down—after all, I couldn't see any smoke coming out of the system—we were able to figure out the problem.

I suppose I felt the same sense of frustration you might have felt. It *had* to be a hardware problem—something in a disk drive or one of those obscure chips inside our Apple.

Some years before, we had another brand of micro and *it* lost data, seemingly at random, whole accounts at a time. One day you'd owe our business $150 and the next you didn't even exist on our disks. Needless to say, it drove us crazy, and got worse as we watched the fight between the hardware and software people. I've never seen so many folks point so many fingers at each other.

We finally told the people from whom we'd leased that unit to take it back, but, hey—we paid cash for our Apple. We couldn't give *it* back. I argued with Bob for a time—I was sure it was a hardware problem and, once he heard what was happening to our data, he was equally positive it was a software error. I might have agreed with him, except that I was the one who wrote the software.

To put things into the right perspective, here's a bit of background. There are two kinds of data files you can use with your Apple. One is a sequential text file, which structures your data as if it all lined up in a row. When you extract data from a sequential file, it reads from the beginning of the file all the way through until it finds the data specified. Consider it similar to the DATA statement in a Basic program; when you instruct the system to read that data, it starts at the beginning and reads as many data items as it's told to. For an application where you don't have to go into your records and change them often, this type of file works fine.

While a sequential text file stores the maximum amount of data in any given space, it's hard to change a specific part, except when you add data to the very end of the file. The DOS manual recommends that you delete the old file and replace it with the new, updated record. But with a long file this can take a lot of time, and in truth it's silly to erase an entire file and resave the new one, just because you changed one or two records inside of it.

The random access file is similar to a line of, say, numbered glasses. Number 3 might be full of information, number 5 might have just a little information in it, with room for more, while the others may be empty. The random access file takes up more memory than a sequential file, as it reserves the space you specify (the amount each "glass" can possibly hold) as soon as anything, no matter what length, is written into it. With this type of text file, however, you can go to any record and change *just* that one. The other data, or "glasses," are not affected when you adjust the information in that record.

For most business applications, this approach makes sense and comes closest to what you're used to doing by hand. Your customers have account numbers, and you're familiar with looking up their accounts on ledger cards. Your inventory items have numbers, so you're accustomed to digging out information on those items based on their particular numbers. Each record in a random access structure has its own "account" number.

It's logical, then, to arrange your financial records on your Apple in the same manner. Random access files fill the bill perfectly. Well, almost. Random access files have one little quirk of their own: You must specify ahead of time how many characters of information you want them to contain—how much space you want each "glass" to hold. This isn't a problem and usually just requires a bit of planning. You total the number of characters each field in your file will require, perhaps put in a little extra room for future use, and tell the system to save that much space for each record.

To do this, you specify the length of the data you expect the file to contain with the L parameter. First, since you want to "talk" to the disk, you must have a control-D in your code. Since control-D is invisible, most programmers put this line first:

```
D$ = CHR$(4): REM CONTROL D
```

To open the file to read from it or write to it, you use a line like this:

```
PRINT D$;"OPEN<FILE NAME>,
L<RECORD LENGTH>"
```

The <FILE NAME> is, of course, the *name* of the particular file you want to access, and the RECORD LENGTH specified after the L is the *length* of the information—in characters—you want the file to contain. The name "Robert," for instance, contains six characters.

Your *Apple DOS (3.3) Manual* outlines the code to use when you want to create and access random access files (pages 81–89). Find other good information in *Basic Apple*

Page 88: "Records should never be longer than the number of bytes specified by the L parameter: records may be partially over-written or combined with confusing results."

Page 126: "If you attempt to WRITE *more* characters in a random access record than you specified in the Length parameter, all the characters are stored correctly on the diskette. However, when you begin WRITING to the *next* record, , DOS calculates the new record's starting position *as if* the previous record had been within the specified length. The new record thus overwrites the last characters of the previous, over-sized record, including the end-marking RETURN character of the previous record's last field. The result is messy."

Figure. The two paragraphs from the DOS Manual *that outline what happens if you put too much information into a random access text file.*

Basic (by James S. Coan, Hayden Publishing, pages 156–168) and in *The Elementary Apple* (by William B. Sanders, Datamost Inc., pages 8.13–8.19).

But curiously, nobody explains what happens when you attempt to put more into a file than it can contain. This is probably because the possible combinations are almost endless, since each file is affected by the length of the information in the files that surround it. Oh, the DOS manual lets you know that you must always specify the length of the information (with the L parameter), but its only warning about overwriting consists of the two paragraphs in the Figure.

Well, that's exactly what happened to us, and I can tell you that the actual results are more "messy" than these paragraphs make it sound. You'd expect that if you entered too much data into a file, it either would not accept the information, or the data simply would spill over into the next record. That is, if you tried to put 550 characters into a file with only 500 "spaces," the extra 50 would be lost, or would take up the first 50 spaces in the following file.

So imagine our chagrin and confusion when neither of these things happened! Once we understood it was a software problem, we broke things down as simply as we could to see exactly what transpired.

Let's say you want to create a random access file that's ten characters long. This really allows space for only *nine* characters of information; you must allow for the carriage return (housekeeping space) at the end of the data. Your line to access this file is:

```
PRINT D$; "OPEN <FILE NAME>, L10"
```

If you work with just the first file on your disk, you can put nine characters into it and you'll be fine. If you

PIRACY PRUF

DEFEAT ALL HARDWARE BOARDS
STOP ALL NIBBLE COPIERS

PIRACY PRUF stops all copy programs now available. It protects every single copy of a program differently. **PIRACY PRUF** randomly generates **BILLIONS** of unique protection schemes. This is the only way to guard against copy parameters. Other protection systems merely make identical copies. For example, disks protected by **Lock-It-Up™** Double-Gold Software, a program which claims to make disks "uncopyable", can easily be copied using the same nibble copy parameter used to copy an unprotected disk. Should you use this system or any system which makes identical copies, parameters can be published to copy your program.

Lock-It-Up™ users: switch to a system which keeps up with current developments. For a limited time only, get a $100.00 credit towards purchase of **PIRACY PRUF**. Call or write for more information and a comparison.

PIRACY PRUF detects the use of all hardware boards by two independent methods.

- Add a disk checking routine to your programs—Broken programs will not run—detects hardware boards.
- Add a language card checking routine to detect the use of hardware boards—detects breaking attempts
- Encrypt basic programs and convert them to unlistable binary files which are BRUN. These files will only decode and run themselves on a protected disk.
- Use a faster DOS to decrease disk access time by as much as 50%

- Erase memory and reboot if program execution stops
- Erase memory and reboot on Reset
- Store Catalog on track 35 (a track not normally used)
- Change DOS commands and error messages
- Clear keyboard to make programs unstoppable which begin with Onerr statements.
- Read and Write between normal and protected disks from within your program
- Scan source disk's VTOC for maximum speed
- Personalize disk with name or serial number of purchaser.
- Stop keyboard entry of DOS commands
- Edit DOS commands and error messages
- Autorun Applesoft Programs
- Define hello type (Exec, Binary, Basic)
- Require the Autostart Rom
- Support up to 14 drives

PIRACY PRUF leaves all sectors usable, and supports the DOS INIT command to allow your program to create protected data disks for data expansion.

PIRACY PRUF provides you with easy to use, state of the art protection, a back-up copy and a complete manual. We thoroughly support our users.

PIRACY PRUF requires 48K, Applesoft, and two DOS 3.3 drives. Protected disks require 48K Apple II w/DOS 3.3 or Apple III in emulation mode, Fully Apple IIe compatible.

The price is $250. A PASCAL version is also available. N.Y.S. residents add sales tax. Send check or money order or for C.O.D.
Call collect at 914-576-6738.

Apple II+ owners can enjoy the calculating power of VisiCalc with "advanced" formatting features found only on the Apple III.

Introducing VisiCalc Formatting Aids 4.5, the latest version of this popular VisiCalc enhancement program which adds print-using to the earlier features of printing variable width columns, formula reading and file handling.

The new global features are as easy as selecting A, B, or C from a menu. There are only 3 VisiCalc-like key commands for non-global formatting of specific grids or ranges of columns or rows. There are 3 other key commands for printing selected rows, controlling line spacing, and issuing top-of-form feeds. These 6 keys are the only non-english commands in the entire program.

No more paste-ups. No more retyping. No more marginal-looking reports. All this without sacrificing VisiCalc memory! VisiCalc Formatting Aids reads files just as VisiCalc does, but instead of taking up memory for calculating power, VisiCalc Formatting Aids is dedicated solely to file handling and report formatting. In fact, it can process huge files created on expansion RAM boards quickly and easily.

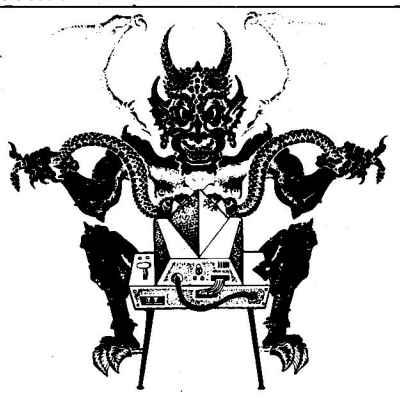

For added flexibility and professional-looking reports, buy your copy today! 48k. Available for the Apple II+, II-E, and Apple III. Call or write for details and the name of a dealer near you. Price $54.95

SARDUCHI SOFTWARE
P.O. Box 1329 A, Dept. 2, Cedar Ridge, CA 95924

"The amount of data in one record can affect other files down the line."

put ten or more in, you start to affect other files that follow, *if* they contain data. Let's say you put fifteen characters into the first record, and ten into the second. The first record will accept the first ten characters you enter for it, but then it will *add* the ten characters of the second record to its own. The second record itself will be fine.

For example, let's say you enter the following:

(Record 1): MRS. WILLIAM MARLOWE
(Record 2): BOB PORTER

When you pull the data from your files, here's what you'll see:

(Record 1): MRS. WILLIBOB PORTER
(Record 2): BOB PORTER

In effect, if you have the maximum number of characters in a file, your Apple will add characters from the file that immediately follows it. If that happens, the first file's information will be truncated to fit the L parameter (if L = 15 then only the first 15 characters of that first entry will be saved), but the entire following record will be appended onto the end of the first record. The second record itself will be fine. Note that a file is affected like this only if the file that immediately *follows* it contains information.

Now, what steps can you take to make sure this problem doesn't occur in your own programs? Apple's Disk Operating System (DOS) doesn't warn you if you try to put too much into a file, and how a file handles your information is dependent on the data that follows it. Bear in mind the golden rule: The amount of data in one record can affect other files down the line.

Remember that you can use the LEFT$ function to truncate string data (A$,B$, etc.) to fit the length parameter. If you leave room for 100 characters of information, you can shorten that data if it runs longer. However, while this approach will save the right number of characters of information for each file, it doesn't inform the operator what's happened to the overflow.

A better method is to measure the characters that are entered, and if their total is too long, instruct the program not to accept the information until the operator enters the data in an acceptable length.

While you can measure string characters, you can't measure the length of numerical entries unless you convert them to strings. However, to perform calculations with strings, they have to be converted back into numerals again (with the VAL function).

But while you can't measure the length of a number, you do know how many characters a numeral of any length contains. Numbers from 1 to 999 can't have more than three characters. Entries from 1000 to 9999 can't have more than four characters, and so on. So, if you have some idea of the numbers a particular program might work with, you can include lines in your program to check the numbers as they're entered, to see that their combined lengths won't overfill a record.

Since there are innumerable combinations of "full," "empty," "partial" and "overfilled" files, the Program Listing is a brief program to let you experiment with random access files. You adjust the length for each record (the L parameter) in line 20 of the program. By changing the length inside the program (rather than in response to a user query) you make sure the length requirement stays the same for all subsequent READ and WRITE actions. When you change the length parameter, make sure you WRITE some sample data to all nine sample records. Otherwise, you try to READ data that was written to with a different length parameter, altering what you see.

This little program allows only nine entries. With more than that it would have to dimension them, and nine should be a sufficient number to permit you to try a number of permutations.

How about too much data in three files in a row, with the rest empty? Or too much data in alternating files?

Program listing. A brief program for experimenting with random access files.

Or each file filled with *exactly* the number of characters you leave room for? The idea here is to get you to discover and think about all the combinations and what will happen to the information inside your files as the situations change.

Once you enter your data, the program will display both your initial entries and what is actually in the files—so you can compare one to the other.

Why not carry things a step further and see what happens to your data when you change the program to save more than one variable in your files? This little program writes to each record in order. What do you think might happen to extra-long data you put into record #2 when #1 already has information stored in it? Why not change the program to find out?

How about inserting a hard-copy print routine after line 400 so you can have a permanent record of what happens to data under various circumstances? Use MON C,I,O to see your input and output from the disk. Experiment with this little program a bit and you'll soon know random access files inside out.

All this should not be interpreted as a statement against this type of file. On the contrary—in the real business world, the random access file is your best friend. We do all of our accounting, payroll, inventory, check writing and graphics with Apple random access text files. You can do more things with them in more ways than is possible with any other file structure. And in truth, your Apple would only be half the computer it is if it could not work with random access files.

I've tried to illustrate what happened to our own records when we tried to put too much data into them. My short program allows you to determine *yourself* what happens to data, with an almost unlimited number of possibilities. As you start to work with the random access file structure, you'll become more comfortable with it, and more effective when you use it for your own business applications. ■

by Bill O'Brien

WordStar Shines

Last month I reviewed Word Juggler, perhaps the best word processing program for the III running in native, nonenhanced mode. This month I'll discuss WordStar, another word processor. However, first I'd like to run through something I missed last month and should really get out front: a functional definition of *word processing*.

Word processing is the manipulation of words, phrases, or, on a grander scale, whole pages of text, without the problems of the traditional (i.e., manual) cut and paste routines. Instead of taking scissors and tape, or bottles of white-out, and remaking whole sections, a word processor enables you to do all of that electronically. Additionally, you can accomplish those little things like centering, underlining, boldface, superscripts and subscripts, headers, trailers and footnotes.

Keep in mind that, because you've found a program that deals with all of the intricacies of your "Epsokitoh" dot matrix printer, it is not necessarily a great word processing program. Conversely, just because you've found one that can't, that, in and of itself, doesn't mean it's a terrible word processor. The archetypical word processing system contains all of the features I've mentioned, *and* its primary output considerations are for state-of-the-art letter quality printers. It may deal with the lower end of the spectrum as well, but not necessarily to the same extent.

With that out of the way then, let's get on to the business at hand.

WordStar

Some things go together naturally. Sunlight and fresh air, steak and eggs, intelligence and the Apple III, and word processing and WordStar. If you imagine the harmony implied by the hands of God and Adam on the ceiling of the Sistine chapel, then you can approach an appreciation of the artistry of WordStar.

WordStar has been around for a long time, and considering the longevity of most micro-related products, that alone says something about it. Unfortunately, it was never meant to run on the Apple, or any computer that did not have an 8080/Z80 (or derivative) microprocessor. Even with that criterion circumvented, if you don't have CP/M (or MS-DOS lately), you still can't use it.

Also, while I say how much I like it—adore it, if that can be—to use it you've got to have a Softcard III. The last time I looked, the Softcard was selling for $450, and WordStar weighs in at $495. That's a lot of love to spend just to do word processing. I don't know if anything short of Nirvana is worth $1,000 if you can't see it, hear it, smell it, taste it and feel it.

Warning! At this writing (June

When you're ready to add disk drives to your system, pick them carefully. Get all the options you need, but don't pay for features you'll never use.

You get that flexibility in Micro-Sci 5¼" floppy disk drives. Choose from a selection that includes everything from a beginner's first add-on to large capacity, high-speed subsystems right for the busiest office environment.

Micro-Sci's **Model A2** is a superbly crafted, 35-track drive which is completely compatible with all Apple II® and Apple IIe® hardware and software. It features a jumper-selectable boot PROM and a price tag its competitors envy. Just right for the budget-conscious consumer!

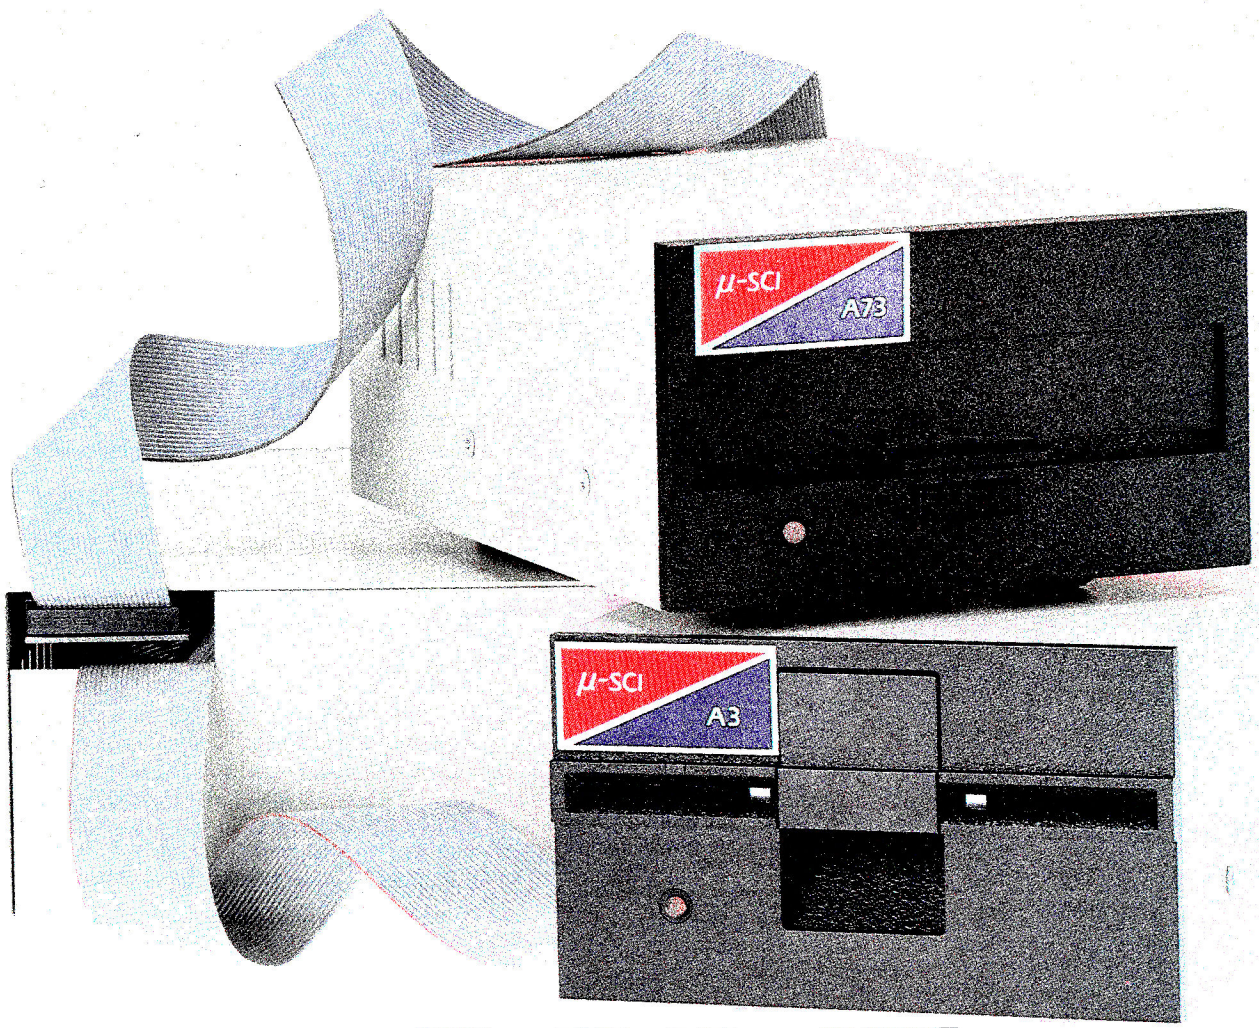

For data processors, the **Model A40** from Micro-Sci boasts increased data reliability, high speed access and a capacity of 164K. And a whopping 286K capacity characterizes the **Model A70** with a 96TPI mechanism—perfect for Pascal® and CP/M® users!

Apple III® owners will crave the **Model A3.** It offers all the features and capabilities of the Disk III® at a fraction of the price. Ideal as a second drive!

At 286K, Micro-Sci's **Model A73** provides Apple III users with twice the capacity of the Disk III, and it plugs right in to the built-in controller—no extra board or power cord!

The king of all Apple compatible drives is the Micro-Sci **Model A143,** the largest 5¼" floppy disk storage system available for the Apple III. 572K storage capacity and the 5 msec access time make the A143 a powerful back-up device for hard disk systems.

One option you'll never see on a Micro-Sci drive is a princely price tag—we control your costs as carefully as we control our quality. So drive carefully to your nearest computer center for a demonstration of Micro-Sci craftsmanship and quality. Do it today!

1983), Micro-Pro has not yet released a version of WordStar specifically for the Apple III using CP/M. The version available for the Apple II runs on the III, but it must be configured to accommodate the screen and cursor control codes that the III recognizes. The installation I'm about to describe is "generic" to WordStar, and there will probably be differences when the actual III version is released. For the modifications needed to configure the terminal with the Apple II version, see the *inCider*, February 1983, III's Company column. If wishes were guesses, I'd imagine that the final III version will eliminate the terminal configuration entirely.

Set-Up and Go

The WordStar program comes basically in an unconfigured form called WSU—WordStar Unconfigured. By running another program on the disk, called Install, you configure it to your system.

This is done by first answering a series of questions regarding the type of display you have. For the Apple III, you'll need to select "other" and do some patching to make it work correctly.

Then you're asked what type of printer you have. The choices run from "any TTY without backspace," through one that can backspace, to a multitude of letter quality printers from a variety of manufacturers. If you're using a dot matrix printer, you'll probably select one of the first two. If you have nothing that even remotely resembles any of the choices, and that's *highly* unlikely, you'll have to do some modifications (ominous words!). The modifications are not simple; though they do not require a knowledge of machine language, you must understand what it is you want to do and what the correct change will be. That being the case, Install will make the change for you.

If you don't have a letter quality printer, you may not be able to do boldfacing and underlining. Notable exceptions that I'm aware of are the Anadex and the Epson, though instead of doing it on the first pass, the printer may go back a few times for the boldface and/or underline.

Finally you must indicate what type of driver you have. In the case of the Apple III version of CP/M that would probably be the CP/M list device, which is, in reality, the SOS driver you've previously selected.

Now you're done with the installation, except for any modifications. The WordStar manual includes a transcript of the terminal and printer driver selections of the configuration procedure. If any changes are to be made, find the label that corresponds to that section, note the choices that will produce the desired result, and type in the name of the location. Then Install prompts you with the current value, asking that you enter the new value. Note that WordStar wants hexadecimal (base 16) numbers.

Although I haven't seen an official copy, the tedious and moderately frightening nature of WordStar's Install is somewhat alleviated in version 3.3 (current at this writing is version 3.0). The questions in the main sections, as well as some of the nonstandard modification sections, have been re-engineered with non-computer users in mind. Apparently, someone at MicroPro decided that writers aren't necessarily programmers.

Menus

WordStar responds to the calling of its name with one of its five menus, the No File Menu (Table 1), across the top of the screen. Beneath that appears a list of files in the directory of the disk you are using. The immediate choices are to enter the edit mode, rename a file on the disk, get rid of the No File Menu (in case you don't need it), change the disk you're looking at (akin to setting the PREFIX$), run two optional programs, copy a file from one disk to another, print out a file (more on that in a moment), run a program (and if you have the CP/M program that formats a disk, you can do that too), delete a file, or exit the program.

If you choose to begin editing, or if

Table 7. Editing commands.

you want to do some printing, you can also do the one you didn't choose. Confusing? With WordStar you can do simultaneous printing and editing. There is some slowing of the printing to accommodate both tasks, but it works.

Upon editing a file (or opening a document), you're prompted for a file name. If WordStar finds that the file already exists, it automatically loads it in. If not, you're placed in the edit mode.

The Edit Screen

The edit screen is about 17 lines deep. The already occupied lines at the top display an editing menu that lists the more common functions: cursor movement, insert, delete, and four other menu choices. (This display can be hidden, if you like, leaving you a 22-line screen to work with.) Included in the space at the top are statistics on the row, column and page you are on, plus a ruler line showing the default tabs. The edit screen defaults to 65 characters wide.

As you type in your document, WordStar allows your letters to approach the right margin. If the word you're typing begins to exceed the margin you've set, spaces are inserted in the line and it is left and right justified (unless you've turned off the justification feature). Then the incomplete word is brought down, flush left, to the next available line. The inserted spaces are not necessarily real spaces. WordStar does microjustification of text with spaces of varying widths, if that feature is available on your printer.

Formatting

That brings us to an important item. WordStar formats your document on-screen as if you were looking at the printed page. You have complete control over the left and right margins, the tab settings (either normal or numeric), and whether or not the document is justified (flushed evenly on both sides). If you want, you can turn off the word wrap-around (the feature that keeps track of when you overflow the right margin), release the margin, and

LOCK-IT-UP

DISKETTE COPY-PROTECTION
AND DUPLICATION SYSTEMS
FOR THE APPLE COMPUTER

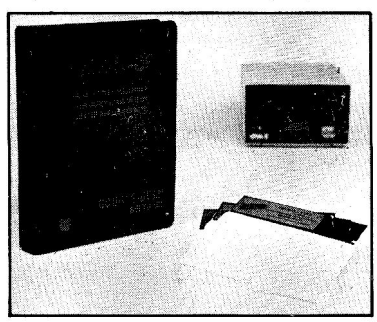

The Lock-It-Up systems are sophisticated, menu driven copy-protection and duplication utilities for the Apple II Computer. They feature several levels of protection which make standard diskettes uncopyable by even the most sophisticated nibble copy programs currently available.

- All sectors on the diskette can still be used.
- Data files can be loaded and/or saved to either the protected diskette or an unprotected diskette.
- Memory will be cleared and the disk will reboot if the reset key is pushed.
- The copying systems support up to 14 disk drives.
- Complete data-verification is optional during copy.
- Sequential serial numbers are assigned to each diskette produced by the system
- Master diskettes created with the system contain an I.D. stamp that you select. The I.D. stamp must be correctly specified before any diskettes can be duplicated. This prevents other Lock-It-Up owners from copying your diskettes.
- Extensive support is provided should you have any problems or special needs.
- Our system is supported by numerous disk copying services should you need a large quantity of diskettes duplicated.

Either system is available for $225, which includes three diskettes, an informative manual, and a non-exclusive license to copy as many diskettes as needed.

ORDER NOW! Call collect for COD, Mastercard or Visa orders

DEALER INQUIRIES INVITED

DOS VERSION:

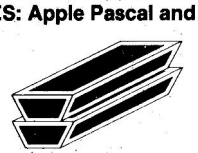

- Any standard DOS 3.3 diskette can be protected.
- DOS command names can be changed and/or deleted.
- Autorun can be used to prevent the listing of a program or the use of any basic commands outside of a program.
- A faster DOS can be used in order to decrease disk access time by up to 50%!

REQUIRES: 48K Apple II or II+ with Applesoft in ROM or language system and at least two disk drives.

PASCAL VERSION:

- Any standard Apple Pascal 1.1 diskette can be protected.
- Files may be transferred to a standard Pascal diskette, but they will not run unless they are on the protected diskette.
- Easily added to any program by use of a Regular Unit.
- Compatible with Apple Fortran.

REQUIRES: Apple Pascal and at least two disk drives.

Table 9. Block handling commands.

keep printing. The screen scrolls sideways with you as you type.

You can also select whether your document will be displayed on-screen with single, double or triple vertical spacing (and it will print just that way, also).

Other menus (listed in Table 2) cover the additional functions of WordStar. One of them, the Help menu, leads to the wondrous (and infamous) dot commands (Table 3). These commands affect the default printer settings and, while they will not always directly affect the screen display, some of them produce cumulative results at print time. Setting the screen display for double spacing, and then using a dot command to set the printer for the same is a good example. Each screen line you see, including the blank one, produces two printed lines—itself and another—to produce the printed double space.

Cursor Commands

Cursor commands (Table 4), in the edit mode, are a little different. WordStar does not use the arrow keys. Rather, in order to preserve its generic nature, it has its own conventions using the control key and a diamond pattern consisting of E (up one line), X (down one line), S (left one character) and D (right one character). Enhanced cursor movements are also performed using the control key, but with A (word left), F (word right), R (back toward the beginning of the document one screenful), and C (forward toward the end of the document one screenful). Alternately, control-W or control-Z scrolls the text while maintaining the cursor position.

"You can select whether your document will be displayed on-screen with single, double or triple vertical spacing."

These cursor commands are further expanded using the commands found in the quick screen menu (Table 6). As you can see, the E key, now preceded by control-Q, puts the cursor at the top of the screen. The X key, with the same control keys, drops the cursor to the bottom of the screen. It works the same for the rest of the diamond pattern.

The editing functions themselves (insertion, deletion, find and replace) are listed in Table 7. The find and replace command, part of the quick screen menu, deserves a small mention. If you select that command, after being queried for the text to be replaced and the text to replace it with, you are asked about options, including where to start looking. While it's looking, WordStar can *ignore* differences in upper- and lowercase. This is a rather important feature as far as I'm concerned.

Setting the margins of the text display, the screen line spacing and on-screen justification are all part of the on-screen menu commands (Table 8). These can be varied within the text so that part of the display is single spaced, another part double, or some of it indented (by resetting the margins), all by setting the appropriate on-screen functions, moving the cursor to where you want the changes, and pressing control-B.

Block Handling

Block handling functions—the moving or copying of sections of text, and the reading or writing of them to disk—are all listed in Table 9. Along with moving standard text segments, if you have used, for instance, a numeric tab for a column of numbers, you can also do column moves.

Almost anything that can be done to augment the printed version of your document is found among the functions in Table 10. It is, by far, the most comprehensive list I've seen. Single keystroke combinations turn the function both on and off.

Finally, Table 11 is a list of the miscellaneous commands available in the editing mode. As you can see, some provide for saving your document and leaving the mode, while others are duplicates of some of the functions available under the No File menu.

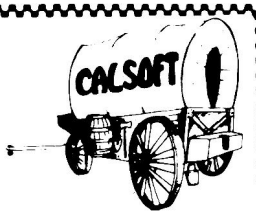

You can embed variables in a WordStar document, with the operator being queried before printing. You can even have a prompt of your choice. Both a list merger and spelling checker are available, at additional cost. Other MicroPro products, such as DataStar and InfoStar (though I haven't seen that yet),

maintain data in a WordStar compatible form, which means you can pull information out of one and insert it in a typed document.

WordStar version 3.3 will also have an optional indexing feature to produce an index and table of the contents of the document typed.

The Pros

What do I like about WordStar? Well, the menu structure for one thing. It makes a full complement of instructions about functions available without tying up more keys than necessary. If you reach the point where you don't need the menus displayed on the screen, you can remove them, or put them back, at your option.

Upon calling in sections of text, they are immediately incorporated into the body of the document you're working on. WordStar is not limited by RAM memory. The only constraint memory places on a document is in limiting the number of pages it can contain at any given time. To explain...

WordStar stores the text you're entering in two places. Part of it is in the machine's memory, but as you fill that up the text is sent out to the disk, in both forward and reverse directions. Limitations on the size of a document are the limitations of the storage capacity of the disk being written to.

"Somehow, between the two of us and the umpteen thousand other Apple III owners, we'll work it out."

That's one of the reasons you can print and edit at the same time.

I like the on-screen formatting. As a writer/typist, the ability to tell, at any time, what page I'm working on, or just how many pages are in the document, or how a table looks in relation to the body of the text, is a real necessity.

I like the fact that I can "print" my document to a disk file exactly as it will come out on the printer. That way I can send it, later on, to a station that doesn't necessarily have WordStar, or, in fact, straight to a printer at a remote site. Neat, huh?

The Cons

I don't like the cost of adding WordStar to the III, although without rewriting WordStar there's no way around it.

After finally graduating to the III and its four arrow keys, the fact that they're useless also irks me. I can only hope that the "official" III version might do something about that.

WordStar cannot handle footnotes—a serious drawback in certain kinds of document work. (Doctoral theses fall into this category.) There are, I am told, utilities produced by other companies that rectify this situation. I can't vouch for it; I've never seen one.

There is no way to index a document, either. The directory display is simply a listing of all of the programs contained on the disk. It would be nice to have some way of telling what a document is, who authored it and when, without calling it in and hoping that the information is there. Again, I'm told there is a utility available to do this, but I haven't come across it.

The only other thing I include on my wish-list is a backup request. WordStar makes a backup copy of a document automatically. Given the constraints of the Apple floppy disk drives (the small ones we all have, not the new generation of monsters), I'd prefer to be asked.

So much for another month, then. If you have anything in specific you'd like me to discuss in this column, write. Maybe you're having a problem with Basic, or just with a file handling aspect of it; it really doesn't matter. Somehow, between the two of us and the umpteen thousand other Apple III owners, we'll work it out.

Live long and program, and see you next month.

Ciao bene, AppleAmerica! ■

THE ADVENTURE GAMES THAT TOOK 3,000 YEARS TO CREATE!

We're pleased to announce what we believe are the greatest adventure games of all time. They're based on stories that have been 3,000 years in the telling. They're filled with people, places and amazing events right out of one of the world's oldest history books. The Bible.

The Bible is where our stories begin. But we've woven *new* adventures through high technology. With stirring action. Startling sound. Dazzling sights. Every member of your family will thrill to the realistic animation and the high-resolution graphics. And you'll share in the pleasures of this unique, new game source—the Bible.

The first of our Bible Adventure Games is *The Philistine Ploy.* Based on the biblical Book of Judges, it starts at a time when law and order have fled from the hills of Judea. It's a turbulent world of intrigue and revenge, altars and idols, heroes and justice. You'll seek the long-lost mythical Treasure of the Seven Nations, racing against a dangerous Philistine warrior who is trying to kill you! But you don't have to know your Bible stories to begin enjoying this adventure game.

Later this year, look for *The Lion's Share* based on the Book of Daniel. You'll be dropped into Babylon, a city filled with dreams, stargazers, wizards and savage lions!

The Bible Adventure Game Series is for Apple II+/IIe computer with 48K and one disk drive. **Games are $34.95 each.**

Ask for these adventure games at quality computer software stores. **Credit card holders may order, toll-free.**

DAVKA ADVENTURE GAMES...WE TOOK OUR TIME.

Fudge It!

by Don Fudge

Fontastic!

In this column I'll describe how to use SUPERFONT, a hi-res character generator that produces characters anywhere from 15-by-15 to 180-by-180 in size, of any color, and in seven or more styles. Included with SUPERFONT (Listing 1) are three other files: CHAR (Listing 2), SCROLL!! (Listing 3) and RETRIEVE (Listing 4).

The CHAR file produces a totally "scale-able" and rotatable vector

Listing 1. SUPERFONT.

Innovative technology brings you quality color printing

for only $599

The technology of the all-new Transtar 315 color printer revolutionizes color impact printing! Unlike old-fashioned printers needing multiple passes with pins to print color, the Transtar 315 employs an innovative 4-hammer print head to allow 7 colors and more than 30 shades to be printed in a **single pass**!

A unique 4-color diagonal ribbon maximizes the efficiency of the 315's color imaging and enhances its simple reliability. Built by Seikosha, the most experienced manufacturing company of the famous Seiko group, the Transtar 315 is **available now** and has been designed to be compatible with the IBM, Apple II/IIe and Franklin personal computers. An optional PICS card also allows Apple and Franklin users to simply depress the 315's "copy" button to print any high- or low-resolution screen without exiting a program!

Transtar is bringing the technology of tomorrow to you today. **Your future in color printing is only $599 away.**

Circle 134 on Reader Service card.

shape table for all numbers and letters, and many symbols as well. These shapes, 52 in all, can be DRAWn, XRAWn, SCALEd, ROTated or HCOLORed in your own programs.

Vector shapes often do not scale up (increase in size) cleanly. The reason is that most people use at least a few move-only commands (without plotting) in their shapes, or, with programs like my Super Shape Draw and Animate, they use diagonal plot-

ting. Now, diagonal plotting is a great asset to a drawing program, as are move-only moves, but both are no-no's if you're going to be scaling up. So the CHAR characters were created (by Mary Carol Smith, president of Avant-Garde) with the plotter remaining on. Use CALL – 151 before typing in CHAR and A$8D00, L$8D0 as the BSAVE information.

The SCROLL!! routine moves everything on the hi-res screen up 64 hi-res lines once the screen fills with characters. Thus you can type forever without running out of space. Once again, use CALL – 151 before typing SCROLL!! in and A2048, L176 to BSAVE.

RETRIEVE allows you to recreate SUPERFONT compositions that have been saved as text files.

Before I discuss the SUPERFONT listing, I must mention one vital piece of information about making SUPERFONT and/or RETRIEVE work: *Before you can use either program you must do the following POKEs*:

POKE 104,96: POKE 24576,0

It doesn't matter if the POKEs are in the Hello program that runs when the disk boots (after which RUN SU

PASSWORD
APPLE DOS!

With PASSWORD +2.3 You can add mainframe protection to your Apple's Disk Language. Restrict Unauthorized Access to the disk. Booted or Not! Ideal for Business, Education, or any multi-user system.

- Uses No Ram memory
- Any Password 1 - 8 characters long.
- Transfer files from non-protected disks.
- Copy programs yield unusable copies.
- All file types A,I,B,T.
- Functions identical to DOS after Password is supplied.

Introductory Price ... $39.95

48K Apple II+, one Drive, and DOS 3.3 required.

To Order the PASSWORD+ 2.3 Send $39.95 plus $1.00 postage in check or money order to:

PERFONT occurs immediately), or if you do them in immediate mode before running SUPERFONT, also in immediate mode. But if you try to install the POKEs in SUPERFONT, *it won't work.*

SUPERFONT

In a nutshell, SUPERFONT displays typed-in text on the screen in a large hi-res format. Many sizes, styles and colors are possible. You can save your compositions and, if RETRIEVE is on the disk, you can summon them back as well. The instructions for using SUPERFONT are right in the program and appear as soon as it starts running. Any time you forget the commands, use control-O to view them again.

Control-P directs your printer to turn out hi-res pictures. Here's how: If you have an Axiom or Silentype, or any other printer that requires only a couple of control characters to produce hi-res pictures, then, after typing control-P, enter the appropriate printer-activating codes. If non-inputtable characters are needed, stick them into line 24020 of SUPERFONT. When using a slot other than

THE VERDICT IS IN

"Odesta has set the standard against which everyone else in this industry will be measured..." Ian Chadwick, InfoAge 6/83

Checkers 2.1 by David Slate

"It's a textbook tutorial on a disk... a primer on artificial intelligence." Softalk 3/83

"...a gold-plated edition of a classic." Apple Dayton Journal 3/83

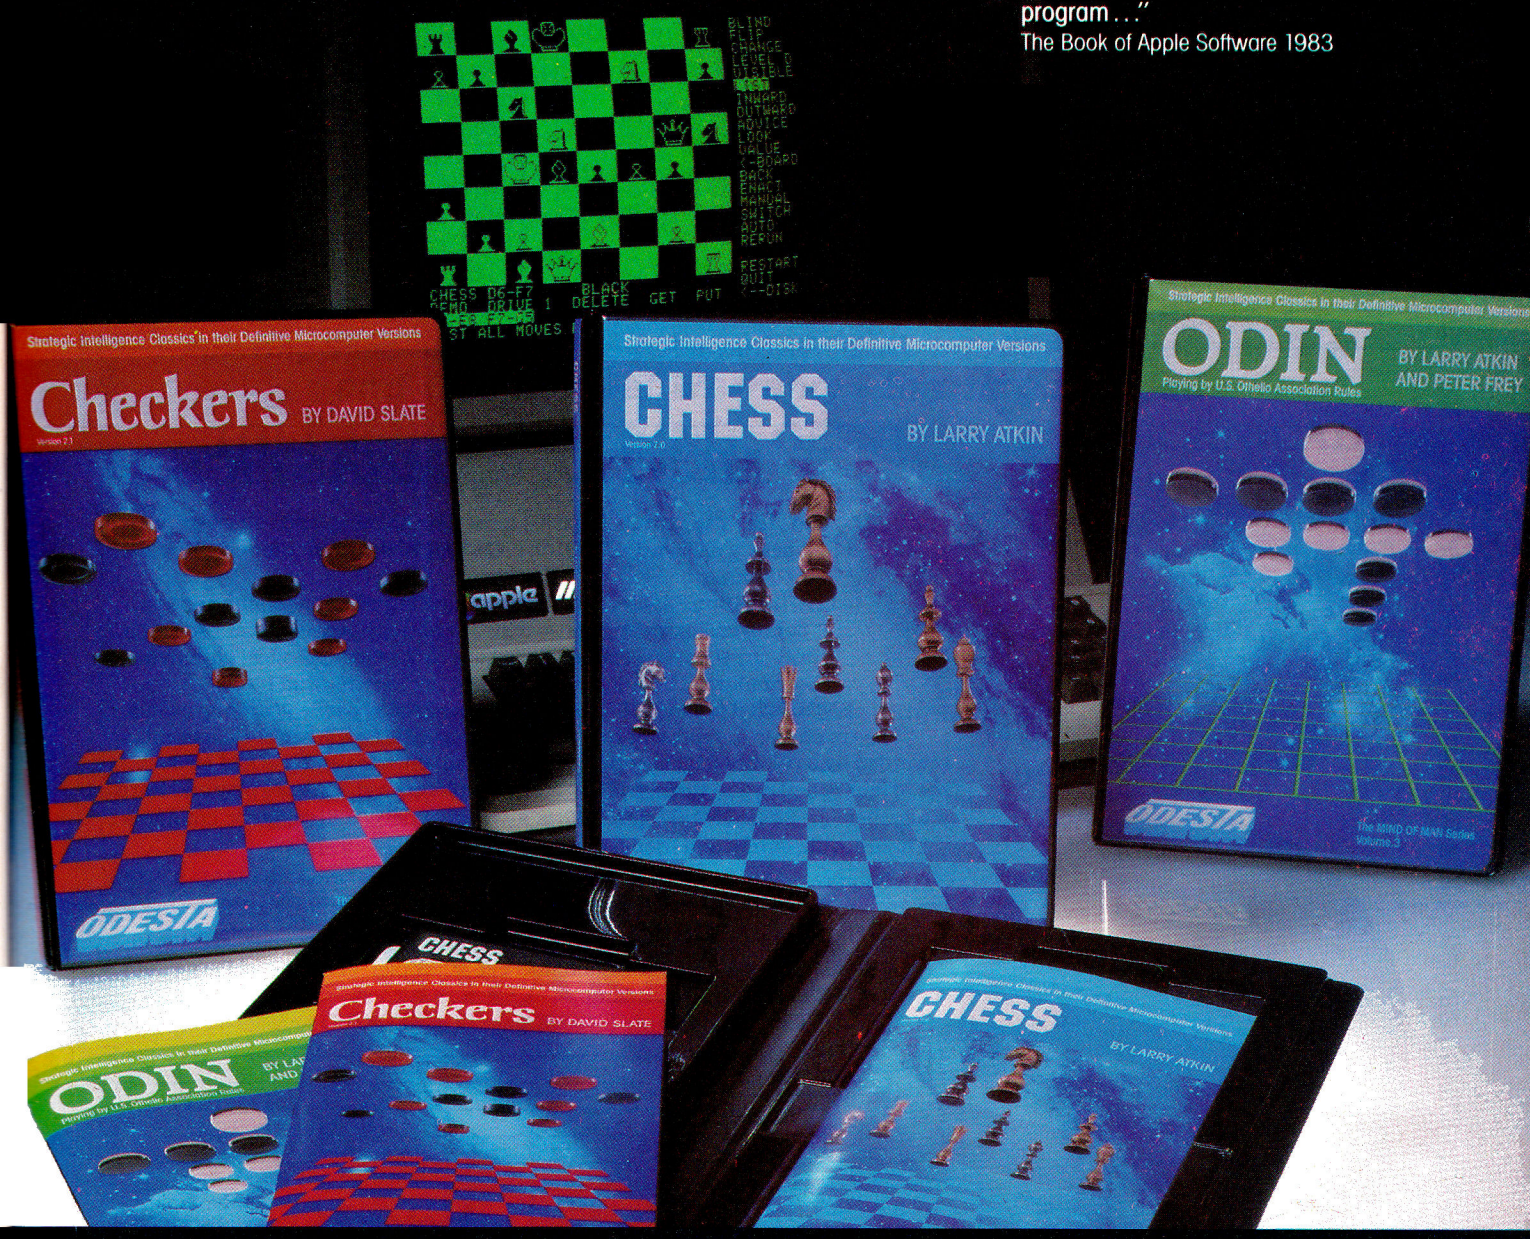

Chess 7.0 by Larry Atkin

"Chess 7.0 is the definitive chess game available on the Apple and Atari computers... It is certainly the best chess program that I have seen for any microcomputer." The Book of Apple Software 1983

Odin by Larry Atkin & Peter Frey

"Odesta has developed a program that not only plays a devastating game of Othello, but also helps you get the hang of it as you go along." Softalk 11/82

"Odin is the definitive Othello program..." The Book of Apple Software 1983

#1, make that change in line 24010.

Should you have an Epson printer, or any other requiring special dumping software, then once the screen contains what you want printed, hit control-reset and run your printer dump software. Don't worry about the screen vanishing when you hit reset. It doesn't really vanish, as POKE – 16304,0 and POKE – 16297,0 will quickly prove.

```

Listing 3. SCROLL!!

To save a SUPERFONT composition, here is what you do. While in the input part of the program type control-S to start saving what you type. You can't save unless you hit control-S first. Then type until you're done or until you have a normal screenful of 126 characters —whichever comes first. When you're ready to quit, hit control-F to indicate you're finished with your SUPERFONT composition.

There are seven styles of letters to choose from. Your selection is made

MENTAL GYMNASTICS

Go for the gold! Improve your vocabulary and sharpen your spelling skills with **ENGLISH OLYMPICS**, a computer event for the whole family.

Test your English expertise and spelling on contractions and comparatives. Increase your vocabulary and try your skills at pronouns and possessives. Choose between correct adverbs or adjectives. Learn plurals, homonyms, antonyms, synonyms, and more.

ENGLISH OLYMPICS consists of ten Olympic-style learning events. Players choose to represent one of four countries. The winner of each event is rewarded by a colorful flag, cheerful set of national anthems and a "Gold Medal". One to four can play and three skill levels allow children and adults to play and learn together. **ENGLISH OLYMPICS** is a word game you'll enjoy for countless hours with family and friends.

Requires: Apple II Plus*, Applesoft, 48K, One Disk Drive #0425AD $39.95

Yes, I would like to improve my vocabulary and grammar skills with **ENGLISH OLYMPICS**. Send me _____ copies @ $39.95. Please add $2.50 Postage and Handling.

using shift-N, except for style #1, which is designated by shift-M. Escape is used for choosing color or scale.

You can go back and fix an error with the color black and the backspace key.

It's possible to create crude animation as compositions are being reproduced with the RETRIEVE program. Also, you can spell a word, go back and erase it, and then redo it in a new color—or change to a new word. This can make a rather nice display when re-created.

"It's possible to create crude animation as compositions are being reproduced."

If you want to retrieve a saved creation, control-R for RETRIEVE sends you to the program of the specified name. The file names of saved SUPERFONT creations are set up to be the letters A through Y, so only 25 compositions can be stored on one disk. However, a bit of program adjustment will make more names possible. There are two to nine sectors in each saved SUPERFONT text file.

If you want a binary picture of any of your creations, just hit control-reset while that picture is on the screen, and then type BSAVE (NAME), $2000, L$1FF8. To retrieve the picture BLOAD it, POKE -16304,0 and POKE -16297,0.

Next time we'll look at one of business graphics' neatest tools, the pie chart.

In closing, may I say I hope you will read this issue well. You'll find some news about an upcoming revolution in Apple graphics. I admit to being co-conspirator in this revolution, and I'm very excited about it. ■

WHEN THE CHIPS ARE DOWN . . .

"master diagnostics + plus"

It's reasonable to suspect that every Apple owner has wondered at some time or another, if all those chips are working up to par, or if it's time for Disk Speed Calibration, Head Cleaning or General Maintenance . . .

Master Diagnostics Plus is a comprehensive diagnostics package for the Apple computers. As a diagnostic set, it can save unhooking all the peripherals and carrying an Apple to the dealer every time a minor hardware problem is suspected or periodic maintenance procedures are required, such as DISK SPEED CALIBRATION, MONITOR ALIGNMENT, DRIVE HEAD CLEANING, etc., etc. Necessary maintenance is made easy by the routines and documentation provided.

For those without a service center nearby, the diagnostic routines can save travel or shipping and considerable downtime for minor problems. Anyone fighting glitches in a program would rest a little easier knowing the computer, at least, is working properly.

As quoted in NIBBLE magazine:
"**Master Diagnostics Plus** is an impressive collection of diagnostic routines for the Apple II and Apple II Plus. It is capable for supplying sufficient information so you know whether or not your computer is performing normally. Regular use of the maintenance routines and supplies will help to insure top-notch operation. The peace of mind afforded by being able to regularly monitor computer performance is well worth the price of the program. This package should be in the library of every Apple user . . . Also received "AAA" reviews in every U.S. Micro Mag.

THE + plus

master diagnostics + plus provides everything needed to maintain your computer. The entire package is housed in our own molded case to protect against static electricity, x-ray and other contaminants.

Included in the kit is:
- THE DIAGNOSTICS DISKETTE
- FORTY PAGE PROCEDURE MANUAL
- HEAD CLEANING KIT + 2 CLEANING DISKS
- CRT SCREEN CLEANER
- COMPUTER/DRIVE HOUSING CLEANER
- REUSEABLE CHAMOIS TIPPED WANDS

The Assembly Advantage

by Randy Hyde

Character Strings

The previous installments of this column have described how to manipulate integer variables with the SPEED/ASM package. Now it's time to explore some additional data types supported by SPEED/ASM. For the next few months I'll discuss how you manipulate character strings, the most important non-numeric type of data.

String Variable Allocation

In part one of this series I described how to allocate storage for a string variable. For the benefit of those who don't have the April edition of *inCider*, I'll first review this procedure.

Unlike other data types in SPEED/ASM (integer, real and character), string variables require a *variable* amount of storage space. The amount of space required depends entirely on how big you wish to allow the string to grow. Strings in SPEED/ASM need n + 2 bytes, where n represents the *maximum* number of characters, up to 255, you will allow the string to contain. The first byte of a SPEED/ASM variable must contain this value. The next m bytes after that (where m < = n) must contain the characters that make up the string. Finally, the first byte following the characters making up the string must contain 0, which SPEED/ASM uses to mark the end of the character string. Figure 1 shows the SPEED/ASM format for a string variable.

Before defining a string variable you must determine its maximum possible size. If you try to store more characters into a string than you allow for, SPEED/ASM will truncate the string and return an error code. On the other hand, if you define a string using the maximum length (255 characters) when at most only 20 characters are ever required, you're wasting a lot of memory space. Obviously, some careful thought must go into deciding how much space to reserve.

The easiest way to do the reserving is to use LISA's ADR and DFS pseudo opcodes. The format for string declaration should be:

```
<label>  ADR   <maxlength>
         DFS   <maxlength>
```

where <label> is the name of the string variable you are declaring and <maxlength> is the maximum string length. <maxlength> must be in the range 1–255. This form of string declaration fulfills three functions: it stores the maximum string length into the first byte (as required), it stores 0 into the second byte (assuming <maxlength> is a value less than 255), and it reserves <maxlength> + 2 bytes as required for a SPEED/ASM string. (Two bytes are reserved by the ADR pseudo opcode, <maxlength> bytes are reserved by the DFS statement.) By storing 0 into the second byte of the string variable, this form of the string declaration initializes the variable to the empty string. The operation of this form

Randy Hyde is proprietor of Lazerwerks, creators of SPEED/ASM. Address correspondence to him at 925 Lorna St., Corona, CA 91720.

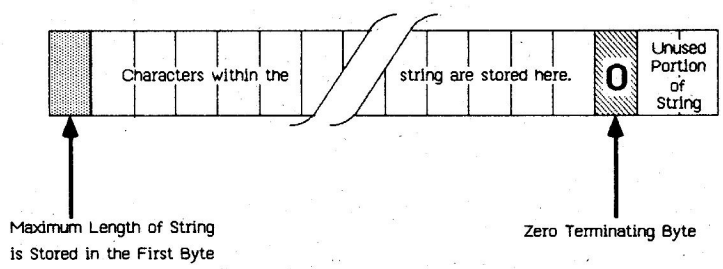

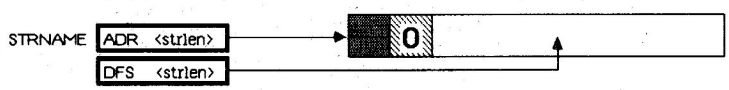

Figure 1. SPEED/ASM string format.

The ADR pseudo-opcode stores <strlen> in the first byte (this is the maximum length value required by SPEED/ASM strings) and then stores a zero into the second byte. This zero initializes the string to the empty string.
The DFS pseudo opcode reserves enough storage for the actual character string. SPEED/ASM strings require exactly <strlen>+2 bytes. By using both the ADR and DFS pseudo-ops in the fashion the required number of bytes are automatically allocated.

Figure 2. Operation of ADR/DFS pseudo opcodes for string declarations.

The STR pseudo-opcode stores a length byte followed by the characters in the string. In this case the STR pseudo-op emits a six followed by the six characters "STRING". The BYT pseudo-opcode emits the zero required at the end of all SPEED/ASM strings.

Figure 3. Using the STR and BYT pseudo opcodes to initialize a string variable.

The LDSTR routine copies the zero terminated string into the string variable whose address immediately follows the call to LDSTR. Note that in this example eight characters are copied: a length byte (which LDSTR computes), the six characters "string" and the zero terminating byte.

Figure 4. Operation of the LDSTR routine.

of the declaration is depicted in Figure 2.

Occasionally you may want to reserve space for a SPEED/ASM string variable and initialize the string to some fixed value. There are a couple of ways to accomplish this, depending on your requirements. If the string value will never change (i.e., you will never store another string value into the variable) then the following definition can be used:

```
<label>  STR   "<character string>"
         BYT   0
```

where <label> is the name of the string variable and <character string> is the data you wish to initialize the string to. The STR pseudo opcode emits the length of the specified string followed by the string itself. Since, in this case, the maximum possible length of the string *is* the length of the string, the STR pseudo opcode automatically emits the proper data for the maximum value. The BYT directive emits the required terminating 0 byte, since STR doesn't do so. This approach is pictured in Figure 3.

Using the STR method to declare an initial value for a string is great if the string value doesn't change during execution of the program, (or if you can guarantee that the initial string value is the largest string value). It is perfect for setting up such fixed strings as error messages and menus. If you need to initialize a string whose initial length *is not* the maximum length the string will grow to, you have to declare the string using the statements:

```
<label>  BYT   <maxlength>,"<string>"
         DFS   <maxlength> + 1 - <length
               of string>,0
```

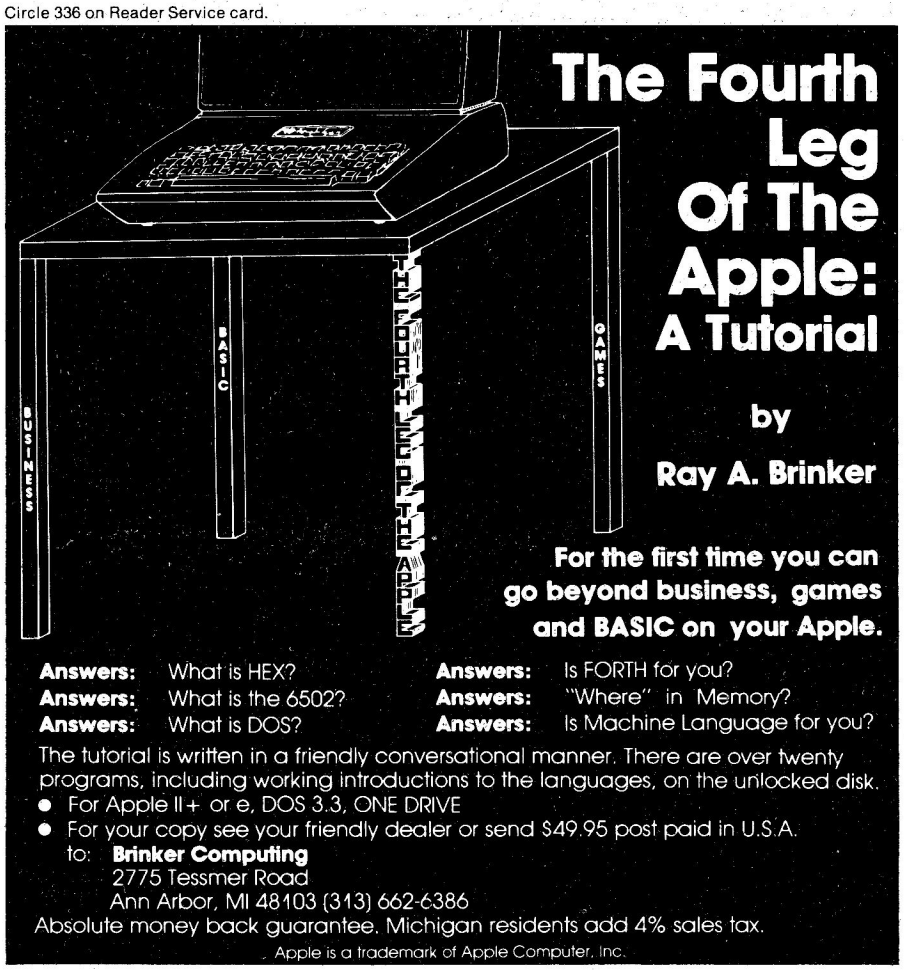

Rather than explaining how this complicated affair works, space is better spent describing how to use SPEED/ASM routines to avoid such statements.

Initializing and Assigning Strings

The most basic string operation is the string assignment. SPEED/ASM supports two routines, LDSTR and MOVS, for this purpose. LDSTR copies a *string constant* into a string variable, and MOVS copies one *string variable* into another.

The LDSTR routine (load a string)

Circle 336 on Reader Service card.

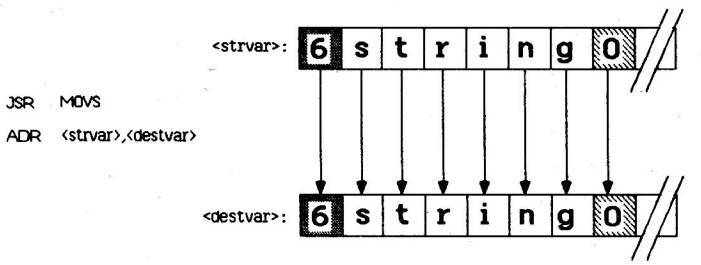

Figure 5. Operation of the MOVS routine.

replaces Basic string assignments of the form:

55 A$ = "STRING"

The syntax for the LDSTR is:

```
JSR   LDSTR
ADR   <deststr>
BYT   "<string constant>",0
```

where <deststr> is the name of the string variable into which you want to store the string <string constant>. LDSTR should be used to initialize a string variable with a string that is shorter than the maximum length. (See the problem in the last section.) The operation of LDSTR is shown in Figure 4.

The MOVS routine copies the contents of one string variable into another. This enables you to translate statements of the form:

100 A$ = B$

into SPEED/ASM. The calling sequence for the MOVS routine is:

```
JSR   MOVS
ADR   <source string>,
      <destination string>
```

where <source string> is the name of the source string and <destination string> is the name of the string you want the source string copied into. The operation of MOVS is shown in Figure 5.

The only problem with using LDSTR and MOVS occurs when you try to store a source string whose length is greater than the maximum length of the destination string. In this case LDSTR and MOVS truncate the string and store the largest string that will fit. Then LDSTR and MOVS return the 6502 overflow flag (V) set if such an error occurs. Likewise, if the error does not occur, the V flag is returned clear. So you can see if a string overflow occurred by checking the V flag (using the BVS and BVC instructions) after a JSR to LDSTR and MOVS.

String I/O

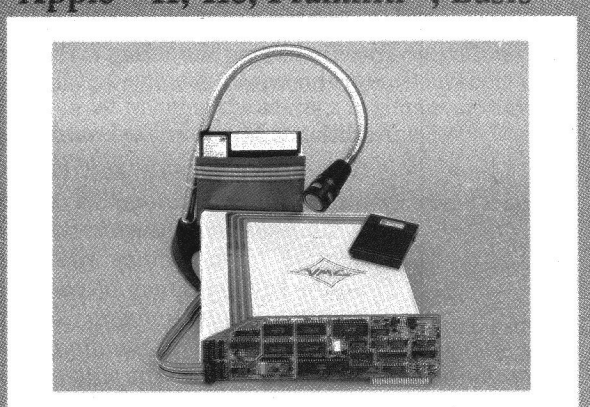

SPEED/ASM provides three routines for performing string input/output. These routines enable you to read a string from the keyboard and store it into a string variable, print

Effective Results — A Sound Away

VOICE INPUT MODULE

Apple® II, IIe, Franklin®, Basis©

DESCRIPTION

The VIM converts spoken words to commands or data for your application programs. The Voice Input Module has unexcelled spoken word recognition accuracy at an unmatchable price.

For ordering or information contact:
VOICE MACHINE COMMUNICATIONS, INC.
1000 S. Grand Avenue, Santa Ana, CA 92705
Phone (714) 639-6150 • (714) 558-1708

® Trade Mark Mastercard Visa Accepted Dealer Inquiry Invited

FEATURES

No application programming necessary
Near perfect recognition 98%+
Unlimited vocabulary using eighty word/phrase subsets
Recognizes anybody's voice
Multi-lingual recognition
Allows simultaneous input of voice and keyboard
E-Prom — repeat function

APPLICATIONS

The VIM is designed to add voice input to ANY existing Apple II application:

- Word Processing
- Data Input and Retrieval
- Education
- Business
- Graphics
- Industrial Automation
- Programming
- Measurement, Inspection and Testing
- Control Systems
- Games and Entertainment
- Aid for Handicapped

VIM FOR APPLE II CONTAINS:

Voice Input Module 2020C with:

- 16 channel audio spectrum analyzer
- 6803 high speed microcomputer
- 8K Bytes of RAM or 16K of RAM

Voice Utility Diskette with:

- Vocabulary builder/editor
- Prompting vocabulary trainer
- Recognition software
- Vocabulary tester
- Merge vocabularies
- Change vocabulary
- 11 Application vocabularies
- Easily defined Syntax

Microphone, Users Manual, cables and connectors.

the contents of a string variable, and print a string constant.

To print a string constant use the PRINT routine, which should be quite familiar to you. We've been employing it all along to print prompts onto the Apple's video display. PRINT needs the calling sequence:

```
JSR    PRINT
BYT    "<string>",0
```

Note that the string constant must be terminated with a 0 byte.

To print the contents of a string variable you can use the PRTSTR routine. Type the statement:

```
JSR    PRTSTR
ADR    <string variable>
```

where <string variable> is the name of the string variable you wish to print.

Reading a string from the keyboard and storing it into a string variable is done by the RDSTR routine. RDSTR reads whatever data is present in the line input buffer up until a carriage return is detected. If the line buffer pointer is already pointing at a carriage return, a new line is read from the keyboard. The syntax for RDSTR is:

```
JSR    RDSTR
ADR    <string variable>
```

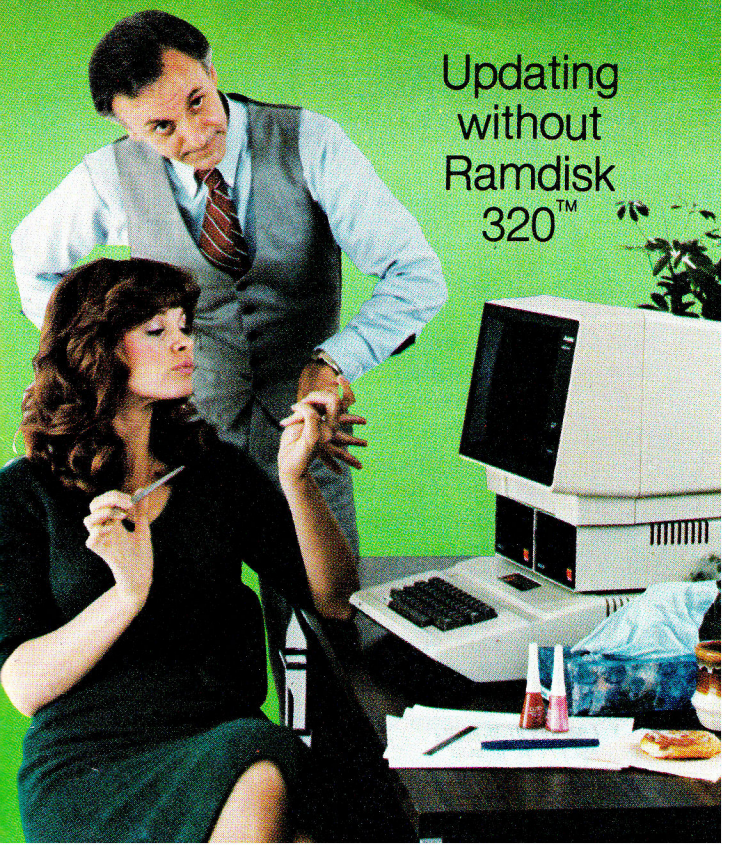

where <string variable> is the name of the string variable. If the string entered by the user is too large for the specified string the V flag is returned set; otherwise it is returned clear.

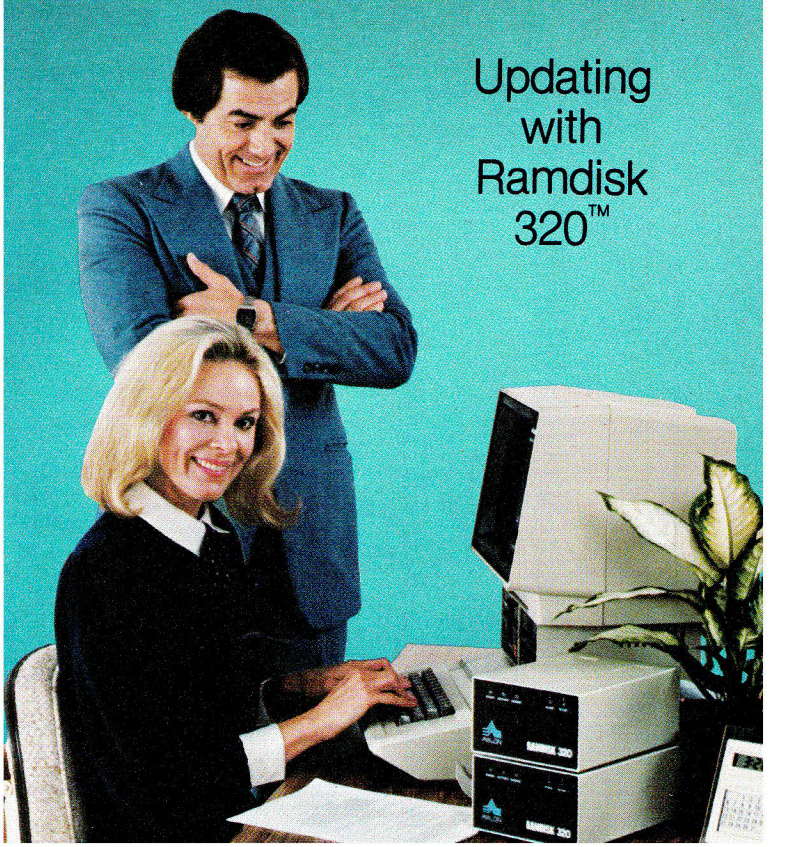

Additional Notes on Keyboard Input

The RDINT, RDSTR and READLN routines all work together in the SPEED/ASM environment. Some information on how they read data from the keyboard may be of help.

RDINT reads an integer from the current position in the line input buffer and leaves the line buffer pointer pointing at the first character beyond the integer read in. If the first character RDINT attempts to read is a carriage return, then RDINT first calls READLN to read a line of text from the keyboard.

RDSTR reads a string from the input buffer starting at the current index into the line buffer. The remainder of the line (up to the car-

2 minutes ..... 12 seconds

.....15 seconds

Can you really afford to waste that much time everyday?

If valuable time is lost everyday while you wait for your computer to retrieve information, then Apple owners rejoice! With Ramdisk 320™ *you can add real productivity to your Apple by moving data 800% faster.* With Ramdisk 320™, our dBASE II™ search and sort time was reduced from an exasperating 2 minutes 12 seconds to a remarkable 15 seconds. Just imagine the savings in time everyday and the added value to your Apple; *Ramdisk 320™ really pays for itself.*

Ramdisk 320™'s powerful 320K byte, self-powered memory draws no current from your Apple and features battery backup as well.

Ramdisk 320™'s solid state memory and error-free **throughput** is designed to increase productivity and reduce wear and tear on your floppy drives. Ramdisk 320™ is fully compatible with Apple DOS 3.3, SOS, CP/M™, Apple Pascal 1.1 and 4.0 at no extra expense.

In addition to the basic Ramdisk 320™ module, you are provided with a plug-in, slot-independent interface card, specially designed operating programs plus software for diagnostics and fast-load copy routines.

Word processing, Accounting, Data Base Management, Software Development, Educational and Scientific Data Processing tasks are accomplished more efficiently. *Add Ramdisk 320™ to your Apple and take a big bite out of lost productivity!!*

riage return) is read in and stored into the specified string. If the line buffer pointer was pointing at a carriage return when RDSTR was called, then a line of text is first read from the keyboard.

If you want to ensure that a fresh line of text is read from the keyboard before reading an integer or a string, you should call READLN *immediately* before calling RDSTR or RDINT. For example:

```
JSR   READLN
JSR   RDINT
ADR   INTGR
JSR   READLN
JSR   RDSTR
ADR   STRVAR
```

If it is inconvenient to call READLN immediately before calling RDINT or RDSTR (an example appears in the sample program, Listing 2), then store the value 0 into the SPEED/ASM GOTLN variable. (This variable is predefined in the SPEED/ASM equates.) By storing 0 (false) into GOTLN you can force the RDSTR and RDINT routines to read a new line of text the next time they are executed, such as:

```
LDA   #FALSE
STA   GOTLN
  .     .
  .     .
  .     .
JSR   RDSTR   ;A new line of text
              ;will automatically
ADR   STRING  ;be read from the
              ;keyboard.
```

String Comparisons Using IFS0 and IFS

The IFS and IFS0 routines compare two strings in SPEED/ASM. These routines are very similar to the IFI and IFI0 integer routines discussed earlier in this series. IFS compares two string variables, and IFS0 compares a string variable to a string constant.

Since IFS0 is used most often, I'll describe it first. The calling sequence is:

```
JSR   IFS0
ADR   <string variable>,<op>
BYT   "string constant",0
```

where <string variable> is the name of a properly declared string variable, "string constant" is the string you wish to compare the string vari-

able to, and <op> is any of the following SPEED/ASM comparisons:

```
EQ    ;Equal
NE    ;Not equal
LT    ;Less than
GT    ;Greater than
LE    ;Less than or equal
GE    ;Greater than or equal
```

These symbolic values are provided in the SPEED/ASM equates, Listing 1.

Upon return from the IFS0 routine the 6502 zero flag is set and the accumulator contains 0 if the comparison was *not* true. If the comparison *was* true, the zero flag is returned clear and the accumulator contains 1. This feature allows you to use LISA's BTR and BFL branches to test the comparison.

The IFS routine is used to compare two SPEED/ASM string variables. The calling sequence is:

Version 4.0

The Ultimate APPLE® Utility Program

COPY II PLUS

Now you can back up your protected software. Copy II Plus is the most sophisticated bit copy program available. It handles synchronized tracks, half tracks, nibble counting, bit insertion and other protection schemes. It also includes a comprehensive discussion of disk format and protection techniques, and instructions on how to back-up dozens of popular programs. A disk system and speed check assure your drives are running in top condition and a nibble editor will allow you to repair damaged diskettes, analyze protection schemes, etc.

The last DOS utility disk you will need. Fully menu driven, the Copy II Plus utilities include a catalog display with binary file addresses and lengths, a disk usage map, and the ability to verify and compare files for differences. It can copy, lock, unlock and delete files and DOS can be copied, or removed from a disk to free up space. You can change the greeting program on a DOS disk, or initialize a disk from scratch. The Copy II Plus sector editor will allow you to view and modify data in either hex or ASCII format.

For your convenience, Copy II Plus is not copy protected for backup.
Available at fine computer and software stores or direct from:

CENTRAL POINT Software, Inc.

P.O. Box 19730-203
Portland, OR 97219
(503) 244-5782

$39.95
(Add $2.00 for Shipping and Handling)

Attention current Copy II Plus owners: Return your original disk with $19.95 for an update to Version 4.0.

Attention IBM PC owners: Call us about backing up your protected software with Copy II PC!

JSR IFS
ADR <str1>,<op>,<str2>

where <str1> and <str2> are two SPEED/ASM variables that are to be compared to one another and <op> is any of the operators listed in the previous paragraph. Examples of IFS and IFS0 appear in Listing 2.

SPEED/ASM supports four string functions: SUBSTR, INDEX, LENGTH and CONCAT. These four functions provide the basic string manipulations required by most programs.

LENGTH determines the current *dynamic* length of a string—that is, the number of characters *currently* stored in the string variable. To call LENGTH use:

JSR LENGTH
ADR <string>

where <string> is the name of the string variable whose length you wish

Why pay $39.95 or more for a single Apple® utility program when you can get over 25 useful utilities for only $69.95

If you write programs, we supply you with over 25 needed utilities to allow you to program easily in machine, assembly or Applesoft™, such as:

- Auto Gen
  Search for a line number, search and disassemble, search and display, etc.
- Disk Utilities
  read, write, update search, etc.
- And many more

If you use programs, over 15 needed and useful utilities allow you to easily recover from almost any error condition.

- Disk maintenance and cataloging made easy.
- Makes disk with errors usable again.
- Pack more data per disk. We increase your capacity by 27 sectors. That's about 7000 characters, without modification of your Disk Operation System (DOS 3.3). ©

Master utility disk comes complete with documentation and two 5¼" floppy disks. Ask for it at your local dealer or send check or money order for **$69.95** or **$14.95** for documentation only (CA residents add $5.20 for tax plus handling) to:

Listing continued.

to find. Since the maximum length of a string is 255 characters (which fits into 1 byte) the length is returned in the 6502 accumulator. This enables you to easily compare the length to an immediate value like:

```
JSR   LENGTH
ADR   STRING
CMP   #55
BGE   STRGE55
```

If you want to store this value into a SPEED/ASM variable, you should store the accumulator into the low-order byte of the SPEED/ASM variable and store 0 into the high-order byte of the SPEED/ASM variable, as in this sequence:

```
JSR   LENGTH
ADR   STRING
STA   STRLEN
LDA   #0
STA   STRLEN+1
```

> **"The SUBSTR routine extracts a portion of a string and stores this substring into another string variable."**

Note that the LENGTH routine returns the current dynamic length of the specified string. If you're interested in obtaining the maximum length of the string, simply load the accumulator with the first location of the string. For example:

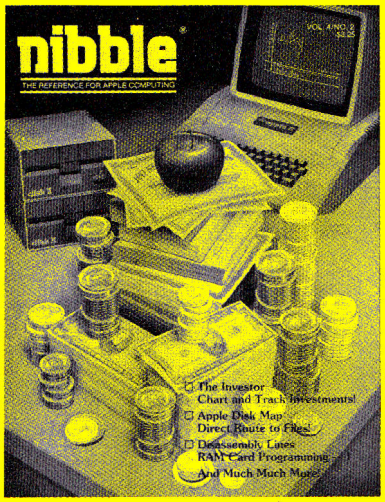

```
LDA STRING ;Fetches maximum length of
           ;string.
```

The SUBSTR routine extracts a portion of a string and stores this substring into another string variable. The calling sequence for SUBSTR is:

```
JSR   SUBSTR
ADR   <source>,<index>,
      <length>,<destination>
```

where <source> is the name of the source string, <index> is the name of a SPEED/ASM integer variable containing an index into the string where the first character of the substring begins, <length> is the name

"NIBBLE® IS TERRIFIC" (For Your Apple)

NIBBLE IS: *The Reference for Apple computing!*

NIBBLE IS: One of the Fastest Growing Magazines in the Personal Computing Field.

NIBBLE IS: Providing Comprehensive, Useful and Instructive Programs for the Home, Small Business, and Entertainment.

NIBBLE IS: A Reference to Graphics, Games, Systems Programming Tips, Product News and Reviews, Hardware Construction Projects, and a host of other features.

NIBBLE IS: A magazine suitable for both the Beginner and the Advanced Programmer.

Each issue of NIBBLE features significant new Programs of Commercial Quality. Here's what some of our Readers say:

- *"Certainly the best magazine on the Apple II"*
- *"Programs remarkably easy to enter"*
- *"Stimulating and Informative; So much so that this is the first computer magazine I've subscribed to!"*
- *"Impressed with the quality and content."*
- *"NIBBLE IS TERRIFIC!"*

In coming issues, look for:

☐ Stocks and Commodities Charting ☐ Assembly Language Programming Column
☐ Pascal Programming Column ☐ Data Base Programs for Home and Business
☐ Personal Investment Analysis ☐ Electronic Secretary for Time Management
☐ The GIZMO Business Simulation Game

And many many more!

NIBBLE is focused completely on the Apple Computer systems.

Buy NIBBLE through your local Apple Dealer or subscribe now with the coupon below.

Try a NIBBLE!

of a SPEED/ASM variable that contains the length of the substring to be extracted, and <destination> is the name of the string where the substring is to be stored. It is important to reiterate that <index> and <length> are the names of SPEED/ASM variables that contain the respective values, not simply the values themselves. If you try to place the value in the position for the index or length parameters, strange things will happen.

> **"If you try to place the value in the position for the index or length parameters, strange things will happen."**

If the substring you extract from the source string is too large to fit in the destination string, SUBSTR returns the V flag set; otherwise the V flag is returned clear. An example of the SUBSTR routine appears in Listing 2.

The INDEX routine lets you check if one string can be found within a larger one. That is, if one string is a substring of another, INDEX returns a value giving you the index of the source string within the second string. The syntax for using INDEX is:

```
JSR   INDEX
ADR   <key>,<source>
```

where <key> is the string you want to search for in the <source> string. If the string is found, the index into <source> is returned in the 6502 accumulator. If <key> is not present in <source>, then 0 is returned in the accumulator. Listing 2 includes some examples of how to use INDEX.

The final SPEED/ASM string manipulation routine is CONCAT. As you will surmise, it concatenates two strings. The calling sequence is:

```
JSR   CONCAT
ADR   <SRC1>,<SRC2>,<DEST>
```

where <SRC1> and <SRC2> are the two source strings to be concatenated

"YOU DON'T HAVE TO GET HIT OVER THE HEAD TO REALIZE HOW QUICKLY APPLE TECHNOLOGY IS CHANGING."

"It used to be that those one-size-fits-all computer magazines were fine for learning more about computing. In fact, they were about all one could find. And it was a treasured issue indeed that contained more than one article about your particular system.

The gravity of this situation was beginning to dawn when suddenly it struck me. . . and I made the greatest discovery of my career, **inCider**.

inCider is a monthly magazine devoted exclusively to the Apple* computer. Each issue contains more Apple-specific information than any other magazine, including:

- programs
- articles
- applications
- new product announcements
- reviews
- tutorials
- utilities

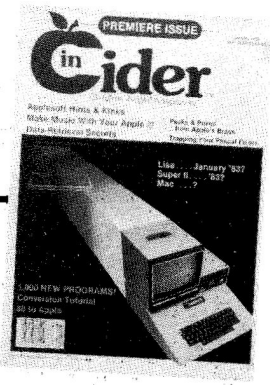

inCider promises to revolutionize the world of Apple computers and for only $24.97. You'll receive 12 monthly issues of **inCider** loaded with money-saving ads and advice, each issue saving you several times your initial investment. Enclose payment or use your credit card and receive a 13th issue FREE! It doesn't take a genius to know a great deal when he sees one."

and <DEST> is the destination string where the result is to be stored. <DEST> should not be the same string as <SRC1> or <SRC2>. If the concatenated result is too large to fit into the destination string, it is truncated and CONCAT returns with the V flag set. If the concatenation was performed correctly the V flag is returned clear. Examples of CONCAT appear in Listing 2.

Putting It All Together

This month's example program (Listing 3) is the beginning of a simple database/mailing list program using all the SPEED/ASM constructs I've presented up to this point. I'll expand on this program next month, so if it seems rather incomplete that's only because it is.

I have now surveyed all the string handling routines provided by the SPEED/ASM package. While these routines provide most of the capabilities you'll require, some "pure" 6502 code is often necessary to make a program run smoothly. Next month, I'll describe the 6502 indexed and indirect addressing modes so you'll have all the string capabilities you could possibly want. ■

JDR 16K RAMCARD

- ★ Expand your 48K Apple to 64K
- ★ Fully compatible with Apple Language System — Use in place of Apple Language card
- ★ Provides extra memory for Visicalc™
- ★ Run PASCAL, FORTRAN, Integer Basic with appropriate software
- ★ Highest quality card features: gold edge connector, sockets for all IC's

WITH 2 YEAR WARRANTY

ASSEMBLED & TESTED WITH WARRANTY..... $44.95

KIT — INCLUDES ALL PARTS & INSTRUCTIONS $40.95

BARE PC CARD WITH INSTRUCTIONS $14.95

APPLE COMPATIBLE POWER SUPPLY $99.95

- ★ Compact Switching Design
- ★ All Outputs regulated
- ★ Short Circuit and Overload Protection
- ★ Complete with Apple-type plug-in power cord
- ★ Apple Compatible — Yet higher output allows more disk drives and cards without overheating
- ★ +5V @ 5A, +12V @ 3A, -5V @ .5A, -12V @ .5A
- ★ Shielded enclosure: 10¾" x 3½" x 2 1/16"

NEW IMPROVED JDR COOLING FAN

- ★ Easy modification — no modification of Apple required
- ★ Eliminates overheating problems
- ★ Switch on front controls fan, Apple, and extra outlet
- ★ Rotron whisper fan is the quietest, most reliable on the market

NOW WITH SURGE SUPPRESSION

UPGRADE
get *IIe* features on your apple II

up to 5 keyboard features with the
REPEATERRRR+™

Auto Repeat: Invaluable. Repeats any keypress, including control characters for scrolling, rubout, etc. **Adjustable delay** to match your typing touch. **ON/OFF control.**

High Speed Cursor: Makes Apple's REPT key a speed control to double the repeat rate of any keypress. Zip through text or across a VisiCalc spreadsheet to get there fast. A must for 80 column displays.

New option for the REPEATERRRR:
SHIFT-key Modification: SHIFT as you should. Get the "standardized" connection (SHIFT-key to Game I/O) while leaving the Game I/O open with our plug-in connector. Supported by most popular word processors (Apple Writer II, Word Handler, Screen Writer II, etc.) and many other programs. Works only with certain software and/or most 80 column boards.

Easy installation. Open top and plug onto 25-pin connector between keyboard and encoder board (fits Rev .7 or later).

REPEATERRRR
without SHIFT-key modification **$24.95**

REPEATERRRR+
with SHIFT-key modification **$34.95**

SPEED UP
WORD PROCESSING
PROGRAM EDITING
VISICALC

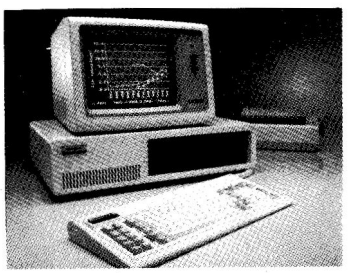

TO ORDER: Ask your local dealer or order direct.

Add $2 per order shipping/handling ($5 foreign). Ohio orders add 6.5% sales tax. Check, MasterCard VISA (incl. card no. & exp. date). 30 day trial — full refund if not satisfied. One year warranty.

SIMPLY THE BEST

IN DIAGNOSTICS
(For Apple® II and *IIe*)

XPS-Diagnostic II & IIe

There's no diagnostic program more comprehensive or easier to use than an *XPS-Diagnostic*. Each program comes complete with a simplified user manual, back-up disk and lifetime warranty.

XPS-Diagnostic tests all major functions of your Apple II or IIe system with minimal user input... **and** it speaks your language.

XPS-Diagnostic II and *IIe* require DOS 3.3 Version II requires 48K.

Tests Include:

MAIN MEMORY	KEYBOARD	MONITOR TESTS
SYSTEM ROMS	PRINTER	GAME PORT
○LANGUAGE CARD	CPU	○○80 COLUMN CARD
DISK SYSTEM	PERIPHERALS	○○AUX. MEMORY
DRIVE SPEED	○TAPE PORT	MEDIA VERIFY

Now Apple users can make their business presentations picture perfect.

If you've ever made a business presentation, you know what a help a graphics department can be. Now with Sensible Software's new graphics program, Graphics Department,™ you can do the graphic pizzazz yourself – faster than any graphics staff! And you'll get your point across with color and impact, whether to your boss, colleagues, customers or clients.

The Graphics Department™ is a new graphics system that combines five major graphics tools into one friendly, easy-to-learn HI-RES graphics package. All visuals produced are HI-RES pictures suitable for printing or turning into slides.

1 The chart generator automatically creates colorful pie, bar, scatter, or line graphs from your tabular or Visicalc™ DIF files. Automatic labeling and direct loading from Visicalc™ help prevent errors and save time on multiple charts. Each graph may include up to 99 data points. You can even overlay multiple images.

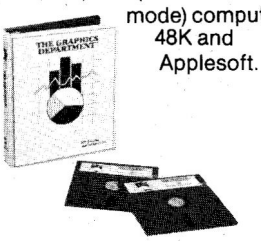

2 The lettering kit includes 20 character fonts . . . from Old English to Bold Modern, from headlines and shadow effects to tiny text. You may letter anywhere on a HI-RES picture with complete control over character size, color and direction.

3 The graphics tools module lets you "cut and paste," overlay, merge, flip, shrink, invert, mask, change colors or add patterns. You can use these graphic tools to edit and combine charts, or even to create pictures from scratch.

4 The slide projector combines your graphics into a professional-looking presentation. You can move "slides" forward or backward with the game paddle or even automatically display them at preset intervals. It's a great way to beat "rush" presentation deadlines!

5 Editors are available in both the charting kit and the slide projector to simplify your data entry.

All these features are now combined into a single package for the first time. Now you can do your complete presentation with just one graphics program. All you need is the Graphics Department™ program, an Apple II,™ //e, or /// (in emulation mode) computer, 48K and Applesoft.

Now available for only $124.95 at your local computer store. Or directly by mail (please add $1.25 for shipping). Visa, Mastercard, COD and checks welcome. For more information or to order:

Get A Head Start In Robotics

Try the Tasman Turtle, an inexpensive and easy-to-control mobile robot, which allows you to explore all the concepts of robotics. Tasman moves, turns, draws, beeps, blinks and "feels" with its touch sensors -- it can even talk with the addition of an optional speech board.

From the novice programmer to the artificial intelligence expert, Tasman Turtles provide a fun way to try out even the most sophisticated robotics concepts.

Easy to control in Basic, Logo or any other high-level programming language, Tasman Turtles come complete with software and documentation, power supply and interface.

Tasman Turtles are available in both Apple® and RS-232 port versions for immediate delivery. To order your Tasman or for more information, contact Harvard Associates, Inc., 260 Beacon Street, Somerville, Mass. 02143 or call (617)492-0660.

NEW OPTION SOFTWARE

ASOC will improve the profit potential of both option buyers and writers. With simplified data entry on multiple options you wish to analyze and compare, the Automatic Summarized Option Comparator processes results for easier reading and retrieval.

For speculators and market professionals who use Apple computers. Utilizes a dividend-corrected Black-Scholes model and an elective Expectation model developed by experienced option traders. Summarized output includes fair price, percentage under/over priced, expectation, hedge ratio, probabilities of various stock price movements and much more. Extremely usable and practical. Requires DOS 3.3 and 48K. Free descriptive brochure upon request.

Send $80.00 for program, backup disk, volatility up-date file disk and manual.

Circle 216 on Reader Service card.

DON'T COOK YOUR APPLE®!

Have you added an 80 column, Z80 or RAM card to your *Apple II*?
Have you also connected disk drives and printers?

If so, your *Apple* runs the risk of overheating, spoiling programs and seriously shortening the life of major components. And look at the tangle of wires that you have!

THE FAN™ is a single unit with a very quiet and efficient cooling fan. It has all the necessary connectors and fits neatly on the back of your *Apple*.

THE FAN also filters out surges and spikes in the main supply which can damage your hardware and corrupt data. A single switch ensures that all peripherals are turned off at the same time as the *Apple*.

THE FAN is simple to attach and remove, and matches the *Apple* perfectly.

TO ORDER, please send check or money order for $155.00 to:

Shipping and handling charges are included. Colorado residents, please add $5.25 to cover 3.5% State sales tax.

HITECK USA
Suite 7061

GET STARTED ON THE APPLE IIe IN UNDER AN HOUR...

Yes... at last, computer instruction is available on videotape.

If the computer newcomers in your family are overwhelmed by technical manuals, we have made it easy. We have extracted the most-needed facts and put them in an easy-to-understand form. We cover:

- Unpacking and set-up
- Installation of circuit boards and peripherals
- Functions of RAM and ROM
- Running software (word processing, electronic spreadsheet, data base management, computer music and computer games)
- And much more.

This videocassette enables the computer newcomer to begin with confidence.

Price: $60.00

MasterCard and Visa holders call toll free:

MasterCard (800) 835-2246 Ext. 35 VISA

Available in VHS and Beta II.

Trapped by the language? They found out in Babel what happens when your language won't do what you want it to.

With AMPER-MAGIC™ there's no need to know machine language to benefit from its power.

To your Applesoft™ programs you can attach, finished machine language routines (referenced by name, not by address) in seconds. No separate BLOADing. And with AMPER-MAGIC commands, you can pass variables back and forth directly, just as with built-in Applesoft commands.

So, name your routine, perform the append procedure, and AMPER-MAGIC takes over — machine language speed where it counts: in *your* programs. Even your commercial programs.

AMPER-MAGIC COMMAND LIBRARIES™ gives you access to hundreds of relocatable machine language routines, including those from magazines and other libraries, and - most notably - those from AMPER-MAGIC itself, which has over fifty routines of its own in two volumes, with more to come.

Imagine!
Only $75.00 for the original AMPER-MAGIC by Bob Nacon
Only $35.00 for AMPER-MAGIC COMMAND LIBRARY™, Volume 2

Plus shipping. MC and Visa accepted.

YOUR KEYS TO. . .

POWER

. . . on the Apple][

zardax

Word processing at its finest. Powerful and versatile, yet easy to use and natural. Designed for the business and professional environment (or for anyone who wants the best). Simple control commands. Typewriter-style shift and lock. Glossary. Form letters and mailing lists. Menus for disk access and printing. DOS 3.3 compatible text files. 40 or 80 column display. Modifiable drivers for most interface cards and printers. $210.

ZIP-COMM

Communications add-on for ZARDAX. Turns ZARDAX into a communicating word processor, to send and receive text files. Talk to other Apples, mainframes, information services, typesetters. Includes terminal mode. 300 or 1,200 baud. Works with serial, modem, and popular 80 column cards used by ZARDAX. Log-on files and X-on X-off supported. $80.

AIDA

"Apple Interactive Data Analysis." **Statistical analysis** package for production research work with large survey data files. Full range of analysis — from descriptive statistics to multiple regression. Complete data manipulation, transformation and case selection. Fast and accurate calculations. Up to 4,000 cases and 255 variables per file. $235.

Just push our button. . .

NO, IT'S NOT TOO LATE!

It's true. The computer revolution is here. But, *it's not too late* for you to take part. You can learn how to program, and BASIC TUTOR can teach you. A step-by-step tutorial designed to teach you at the keyboard, BASIC TUTOR consists of nine disks containing over 100 programs for use and study. From beginning topics like data input to advanced topics such as creating shape tables, BASIC TUTOR will be your guide into the world of programming. All 9 disks for the special series price of $280 or individual disks at $36 each.

Individual Disk Titles

Systems Commands

KID'S CORNER™

MAGIC CRAYON offers "a gentle, inviting opportunity for kids from age three on to become comfortable using the computer." (Softalk, June, '83)

MAGIC CRAYON gives children:

- **Power to draw, select colors and watch the computer re-draw their own pictures.**
- **Easy-to-understand instructions, in picture form for prereaders.**
- **Adjustable skill levels. $35**

LEARNING ABOUT NUMBERS, 3 programs using colorful, lively graphics to teach counting, time-telling and arithmetic. $40

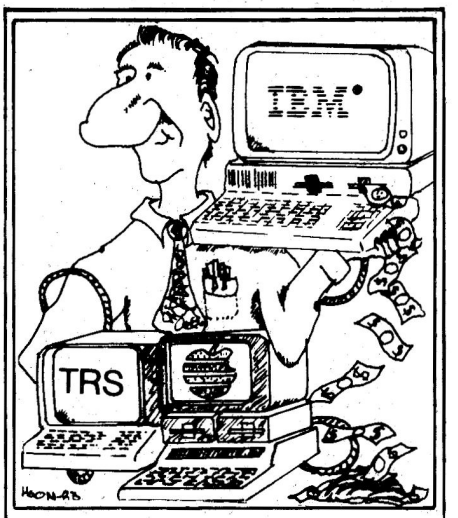

C & C SOFTWARE

FILE TRANSFER PROGRAMS

TRS → IBM PC or XT
APPLE → IBM PC or XT

Transfer your TRS Model I, II, III, 4, 12 or 16 files to the IBM PC or XT.

Transfer your Apple II, II+, or IIe files to the IBM PC or XT.

- No more retyping or wasted time
- Fast transfer-baud rates of 110-9600
- File concatenation supported
- Send files of any length
- Make $$$ - the IBM PC is new and software is scarce-take your "new" programs and sell them for $$$.
- Transfer ASCII files, random files, text files, data files, binary files, high level language programs (Basic, Pascal, Fortran, Cobol, etc.), electronic spread sheet data, word processor files, etc.; it all gets transferred!

The File Transfer Program comes complete with all instructions, hardware and software (for both machines)

FILE TRANSFER PROGRAM diskette
(Works with IBM DOS 1.1 or 2.0)

APPLE ___ $94.95
TRS ___ $89.95

(State TRS model when ordering)
Plus $2.00 shipping & handling
(CA residents add 6.5% State sales tax)

MC/VISA/COD/CHECK OK

Phone orders call

A word for this Punch/Reader Combo is .....

Speed! Model 510 punches paper tape at 110cps, reads at 150cps. This rugged machine is computer compatible offering RS232C, current loop, parallel inputs. The ASCII-to-Baudot code conversion permits direct keyboard entry for Telex/TWX transmission. Plus: 256 character storage, 75-9600 baud rate, 5-8 level tape, stock. ADDMASTER CORP. 416 Junipero Serra Dr., San Gabriel, CA 91776 ★ 213/285-1121.

Circle 56 on Reader Service card.

AMPERGRAPH

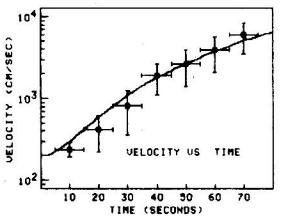

AMPERGRAPH is a powerful, easy-to-use relocatable graphics utility for the Apple II +/e. AMPERGRAPH adds twenty-two Applesoft commands that allow effortless generation of professional-looking plots of scientific or financial data. All of the necessary scaling and screen formatting is accomplished with just a few, simple Applesoft lines.

Unlike most other plotting systems for the Apple II which are stand-alone systems, the AMPERGRAPH utility provides extended BASIC graphics language macros that you can use directly in your own Applesoft programs. The additional commands are &SCALE, &LIMIT, &AXES, &GRID, &FRAME, &LOG X, &LOG Y, &LABEL AXES, &LABEL, &VLABEL, &CENTER LABEL, &CENTER VLABEL, &DRAW, &PENUP, &CROSS, &OPEN SQUARE, &CLOSED SQUARE, &OPEN CIRCLE, &CLOSED CIRCLE, &ERROR BARS, &DUMP (to dump the graph on a Silentype printer) and &*DUMP (to link with AMERDUMP, see below).

$45.00

SAMPLE AMPERGRAPH PROGRAM LISTING:

```
10 &SCALE, 0, 80, 80, 13000
15 LX$ = "TIME (SECONDS)":LY$ = "VELOCITY
   (CM/SEC)"
20 &LOG Y: &LABEL AXES, 10, 10
25 LABEL$ = "VELOCITY VS. TIME":&LABEL, 30,
   200
30 FOR T = 0 TO 80:&DRAW, T, 150 + T12:NEXT T
35 FOR T = 10 TO 70 STEP 10
40 &CLOSED SQUARE, T,
   (150 + T12)*(.8 + .4*RND(3) )
45 &ERROR BARS, 5, T12/2
50 NEXT T:&DUMP
```

AMPERDUMP

AMPERDUMP is a high-resolution graphics dump utility which can be used either in menu-driven mode, or directly from your Applesoft program, with, or without AMPERGRAPH. The following printers will work with AMPERDUMP: Epson MX-80, FX-80, MX-100; Apple DMP, NEC PC-8023A-C, C. ITOH 1550, 8510A/B, 8600. AMPERDUMP offers many features which are not available in other graphics dump routines:

- Horizontal magnifications: 3 with Epson printers (2.33 to 6.99 inches); 12 with all others (1.75 to 7.78 inches)
- Vertical magnifications: 9 with Epson printers (0.88 to 7.96 inches); 6 with all others (1.33 to 8.00 inches)
- Horizontal and vertical magnifications can be specified independently.
- Normal / Inverse dumps
- Fast
- Adjustable horizontal tab
- Easy to use
- Compatible with AMPERGRAPH
- Relocatable

$40.00

The AMPERGRAPH and AMPERDUMP graphics utilities require an Apple II +/e (or Apple II with language card). The AMPERDUMP utility requires one of the following interface cards: Epson, Apple, Grappler, Interactive Structures, Mountain Computer, Epson Type2, Tymac, or Microbuffer II.

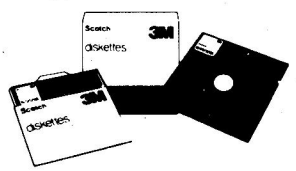

AMPERGRAPH and AMPERDUMP are available from your dealer or order direct. Include $2.00 for shipping and handling; Wisconsin residents add 5% sales tax.

Circle 183 on Reader Service card.

Your secretary types reports and revises project budgets on an Apple microcomputer. Why should you be stuck with the same pen and ink used by medieval alchemists? An ALIS automation system together with your Apple II can eliminate manual recording and setting of instruments. ALIS systems can work with pH meters, strain gauges, timers, positioners, microbalances, flow meters, BCD devices — in short almost ANY device which accepts or generates an analog or digital signal.

ALIS makes automation easy

Each ALIS system is complete with preassembled hardware, from Apple interface to cabling, terminal box and test switches — as easy to install as a printer. ALIS' interface software lets your Applesoft programs talk directly with the real world at up to 10,000 data points per second. You can display your results immediately or off-line with ALIS' modifiable hi-res graphing system. Each ALIS system is thoroughly documented with over 150 pages of readable manuals, including sample programs and application notes to assist in automating your lab.

ALIS automation systems are available NOW in the following configurations:

- **Precision Analog Input: ALIS/A12** **$1517**
  (16 channels, 0.024% Prec., 8 ranges, 100mV min)
- **Analog Input: ALIS/A08** **$1149**
  (16 channels, 0.39% Prec., 5 Volts Full Scale)
- **Analog Output: ALIS/AO** **$841**
  (2 channels, 0.39% Prec., 10 Volts Full Scale)
- **Digital Input/Output: ALIS/DIO** **$1600**
  (32 bi-directional channels, quad timers, interrupts)

Available soon: ALIS/MX256 — 256 channel analog input.

ALIS systems require a 48K APPLE, APPLESOFT, DOS 3.2/3

Book Reviews

Polishing Your Apple

by Herbert M. Honig
Howard W. Sams & Co. Inc.
Indianapolis, IN 46268
Softcover, 77 pp., $4.95

As Herbert Honig says in his preface learning to program computers is not hard for people used to tackling problems in a disciplined way. If you are such a person, *Polishing Your Apple* may be for you—provided you are also a newcomer to Applesoft.

This little book introduces you to a useful subset of Applesoft Basic plus a few disk-related commands. No attention is paid to graphics or fancy sound. This is quite appropriate, given the author's clearly stated intent to provide you with a primer for quickly learning to write serviceable programs.

The author focuses on the Basic commands that appear in almost any program. The function of each is briefly shown in a program, and a line-by-line description of the program's operation is given. Too few books for beginners provide this kind of description, yet it makes learning much more efficient.

In addition to the programs, techniques for entering, debugging and editing them are concisely presented. Useful tips abound, like the handy POKE 33,33 for editing print statements. Many of us self-taught programmers have had to glean this and other good tips from all over—from Apple's own books, friends, magazines and so on. Here they are introduced when needed to make your programming job easier.

Much is packed into the short space of this book. The first program is a simple three-liner; the last is a fairly sophisticated one using files. There is even a section containing helpful hints for making good use of popular printers like the Epson.

Some may find the concentration of information and fast pace overwhelming. Others will find *Polishing Your Apple* just what they have been waiting for. ■

Introduction to Computers and Data Processing

by Gary Shelly and Thomas Cashman
Anaheim Publishing Company
2623 Saturn St.
Brea, CA 92621

Certainly among the best of the myriad EDP and programming texts on the market is the series from Anaheim Publishing Company. Authors Gary Shelly and Thomas Cashman, both educators, have collaborated on some 20 textbooks to date, running the gamut from *Introduction to Programming* to *Business Systems Analysis and Design*.

Of interest to teachers of secondary school computer science, computer literacy and data processing courses will be *Introduction to Computers and Data Processing*, a magnificently planned and beautifully illustrated text (190 manufacturers supplied photographs). In some 500 pages the book examines the evolution of the computer industry, processing concepts, data input and information output, auxiliary storage and file organization, data communications, systems analysis, database processing, program design, programming languages and the future of computers in society.

This book forms the core of a complete set of support materials, a student workbook and study guide plus answer manual, transparency masters for all illustrations in the main text, instructor's guide to the text and a complete test bank (2040 questions) organized by text chapter. Also available is *Introduction to BASIC Programming*, to complement the programming coverage in the primary text. This latter book is also accompanied by a set of lesson plans and solutions to assignments, as well as a test bank with mid-term and final examinations.

Educationally sound materials are not cheap, however. The core text is priced at $18.95, the programming supplement at $14.95 and the workbook/study guide at $7.95. It is unlikely, though, that a comparable set of books is available at any price at the moment. ■

BASIC Exercises for the Apple

by J.P. Lamoitier
Sybex Inc.
2344 Sixth St.
Berkeley, CA 94710
$12.95

At one time or another, almost all personal computer users are exposed to some dialect of the Basic programming language. Applesoft is easily the most popular language in use on Apples.

You can take many different approaches to learning a subject such as Basic, each with benefits and drawbacks. Three new books, each in-

Circle 310 on Reader Service card.

tended to provide fluency in Basic, give three different but equally effective approaches.

The first of these books, *I Speak BASIC to My Apple*, is a teacher's guide to be used in a formal class environment. To use the program as it is intended, each of the students would be provided with a student text, and have access to an Apple computer.

This book is written for computer novices and takes nothing for granted. *I Speak BASIC to My Apple* starts with a basic overview of a computer system, explaining input, output, storage and the many cornerstones of computer literacy in an easy to understand manner. The concept of a program is introduced, with appropriate examples of Basic instructions. The book is completely Apple-oriented—illustrations are always of Apple II keyboards, video displays, etc. This is far from a shortcoming; many general instructional texts on the subject give examples that may work on one machine but not another. No danger of that here.

Although the information that it covers is limited in scope, this book is is thorough with what it does discuss. The most basic of Basic commands are discussed, and examples of their use are given. Periodic quizzes and exercises along the way reinforce what is learned. The book, however, does not venture far beyond introductory low-resolution graphics commands, basic subroutines, loops and simple arrays. Disk drives are not mentioned; the book assumes none are connected to the machine in use.

While not the book for those who are already comfortable with Basic, *I Speak BASIC to My Apple* is ideal for introducing another family member to the language, as well as for its intended classroom use. It meets its goals with skill, and would be an excellent addition to the library of any computer club.

***

Also from Hayden books comes *Basic Apple BASIC*, a slightly more advanced approach to the subject, yet one that a novice can feel comfortable with right from the start. *Basic Apple BASIC* is a well-structured book, introducing commands in a logical progression. Each section is summarized with a review and a selection of problems to solve using the information learned. A nice feature is the Programmer's Corner, a small section at the end of each chapter for the more adventurous; it gives some advanced programming ideas and focuses on some of the Apple's special features. These sections are *full* of valuable tips and interesting techniques.

Some of the more difficult concepts in programming, such as random-access disk files and shape tables, are clearly presented. From the most basic of Basic to the most mind-boggling, this book covers it all. At $12.95, *Basic Apple BASIC* would have to be called a value and a must-have for any serious programmer. Mr. Coan's book has something for everyone interested in the Apple. Its valuable information, along with the author's upbeat and enjoyable writing style make this a book that I can recommend highly.

***

Another interesting book on the subject is *BASIC Exercises for the Apple*, by J.P. Lamoitier. Rather than showing what functions various Basic commands perform, as most books do, *BASIC Exercises* presents its information in an unusual form. Problems are presented, and the book shows the various steps to solve them using Basic. This is not a book for the utter novice; some knowledge of Basic is needed to get the most from the material presented. A heavy emphasis is placed on flowcharting, and the concept is covered in depth.

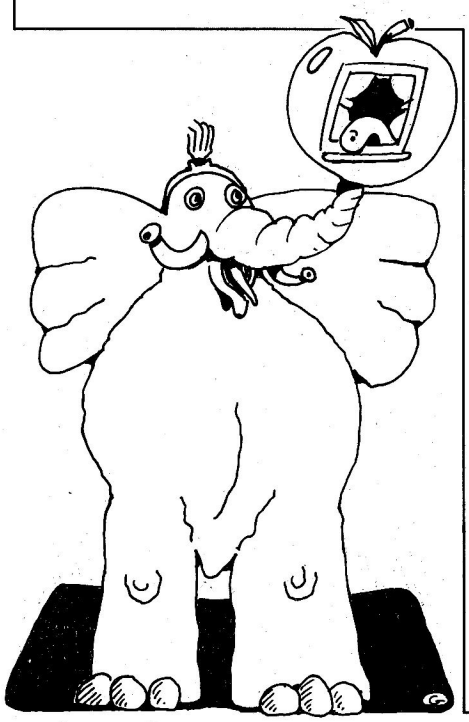

A typical example of the material in this book is an exercise to find the first N prime numbers, with N varying between 10 and 60, via a Basic program. The book concentrates on careful definition of the problem itself, the first step in solving it. An algorithm is then developed, then transferred to a flowchart and later to Basic. Improvements to the original program are added as the exercise progresses until the final result is a well-tuned, logical solution to the problem.

Many of the exercises in this book deal with concepts few of us use in everyday life, such as Armstrong numbers (numbers for which the sum of the cubes of the individual digits add up to the number itself) and linear regression. Following the steps taken in solving these difficult problems can make more common problems much easier to deal with.

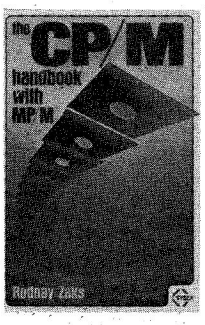

While this may not be the book for the casual user of Basic, *BASIC Exercises for the Apple* is an excellent workout for any dedicated programmer. Mr. Lamoitier presents solutions for seemingly unsolvable problems, and does so with an ease that may have many readers thinking, "Why didn't I think of that?" All in all, this is an excellent book, but definitely not for everyone.

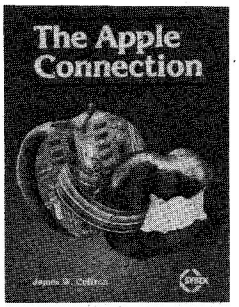

Three books, three approaches to the same subject. Each of them effective in its own way, and all of them well worth your consideration. ■

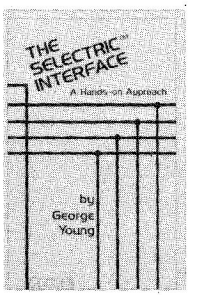

W. Charles Doherty
S. Dartmouth, MA

inCider BOOK SHELF

THE BOOK OF APPLE SOFTWARE—edited by Jeffrey Stanton, Robert P. Wells, Ph.D., and Sandra Rochowansky. Are you bewildered by the thousands of Apple II programs on the market? Here is the advice you need, with descriptions, ratings, and evaluations of over 500 of the most popular programs for the Apple II. You'll find reviews of business, education, game, and utility programs, and advice on hardware options and software vendors. BK1265 $19.95.

THE APPLE CONNECTION—by James W. Coffron. Connect your Apple to household appliances for greater control. With this book you will learn about elementary interfacing and about BASIC programming, including input/output techniques and devices, building real systems, and even analog to digital and digital to analog conversion. All programs are written in BASIC and no prior electronic knowledge is required. BK1262 $12.95

MICROBOOK: DATA BASE MANAGEMENT FOR THE APPLE II—by Ted Lewis. This book provides you with an affordable data base management system for your Apple II. These programs turn your Apple II into a combination filing cabinet, information gathering/retrieval system and data processing engine. Written in Pascal, the programs simulate a library. Information is maintained and broken down into books, chapters and pages and index to pages. Photographs of the Apple II screen are abundant, and they show you step-by-step the effect of each of your entries. Microbook can be used for almost any application involving the storage and retrieval of information. BK1261 $19.95

APPLE GRAPHICS AND ARCADE GAME DESIGN—by Jeffrey Stanton The only book available that explains how to design arcade games from start to finish through the use of text, flow charts and working examples. Learn how to speed up your graphics, and the theory of how to design a playable game. This book requires a solid foundation in BASIC programming on the Apple II. BK1259 $19.95

THE VISICALC BOOK—APPLE EDITION—by Donald H. Beil. If you are presently using Visi-Calc on your Apple II or want to learn more about its expanded uses, this book is for you. It will show you how to build a model, enter your data, and begin to explore all of your "what if" questions about any aspect of your business. There are also a large number of practice problems included in this book to help you become a skilled user. BK1268 $14.95

THE SELECTRIC INTERFACE—by George Young. You need the quality print that a daisy wheel printer provides but the thought of buying one makes your wallet wilt. SELECTRIC™ INTERFACE, a step-by-step guide to interfacing an IBM Selectric I/O Writer to your microcomputer, will give you that quality at a fraction of the price. George Young, co-author of *Kilobaud Microcomputing* magazine's popular "Kilobaud Klassroom" series, offers a low-cost alternative to buying a daisy wheel printer. SELECTRIC INTERFACE includes: step-by-step instructions, tips on purchasing a used Selectric, information on various Selectric models, including the 2740, 2980, and Dura 1041, driver software for Z80, 8080, and 6502 chips, tips on interfacing techniques. With SELECTRIC INTERFACE and some background in electronics, you can have a high-quality, low-cost, letter-quality printer. Petals not included. BK7388 (125 pages) $12.97

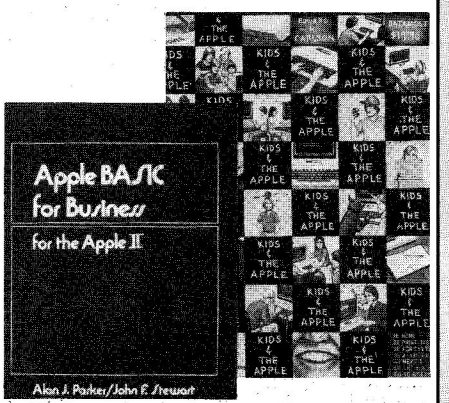

THE APPLE II USER'S GUIDE—By Lon Poole, Martin McNiff, and Steven Cook This guide is the key to unlocking the full power of your Apple II or Apple II Plus. Topics include: "Applesoft and Integer BASIC Programming"—especially how to make the best use of Apple's sound, color and graphics capabilities. "Machine Level Programming," "Hardware Features"—which covers the disk drive and printer, and "Advanced Programming"—describing high resolution graphics techniques and other advanced applications. Well organized and easy to use. BK1220 **$17.95**

THE CP/M HANDBOOK (with MP/M)—by Rodnay Zaks. A complete guide and reference handbook for CP/M—the industry standard in operating systems. Step-by-step instruction for everything from turning on the system and inserting the diskette to correct user discipline and remedial action for problem situations. This also includes a complete discussion of all versions of CP/M up to and including 2.2, MP/M and CDOS. BK1187 $14.95.*

MASTERING CP/M—by Alan R. Miller For advanced CP/M users or systems programmers who want maximum use of the CP/M operating system, this book takes up where the *CP/M Handbook* leaves off. It will give you an in-depth understanding of the CP/M modules such as CCP (Console Command Processor), BIOS (Basic Input/Output System), and BDOS (Basic Disk Operating System). It explains the incorporation of additional peripherals to the system, console I/O, the use of the file control block and much more. It also includes a library of useful macros and a comprehensive set of appendices. BK1263 **$16.95**

NEW

APPLE BASIC FOR BUSINESS: for the Apple II—by Alan J. Parker and John Stewart. Unlike most introductory BASIC books, this book uses files extensively. It is written specifically for the Apple II microcomputer with DOS Version 3.2. All programs presented are compatible with DOS Version 3.3. With the emphasis on problem-solving, the focus of this book is the point at which problem elements meet language capabilities. BK1247 $15.95

MOSTLY BASIC: APPLICATIONS FOR YOUR APPLE II, BOOK 1—by Howard Berenbon. This book provides you with 28 ready-to-use, BASIC language programs which have been completely tested and debugged for use on your Apple II. Includes a telephone dialer, digital stop watch, spelling test, a house buying guide, a gas mileage calculator, and many others useful to businessmen, hobbyists, scientists, and computer enthusiasts. BK1251 $12.95

MOSTLY BASIC: APPLICATIONS FOR YOUR APPLE II, BOOK 2—by Howard Berenbon. A second gold mine of fascinating BASIC programs, including two dungeons that test your math and history abilities and another one that's strictly for fun, eleven household programs, a monthly savings plan and six more on money or investment, two that test your level of ESP, and more—32 in all! Excellent for beginning or advanced computerists. BK1252 $12.95

KIDS AND THE APPLE—by Edward H. Carlson. Whether you are a kid, a parent, or a teacher, this book is something unique. It starts with the bare bones introduction to programming, leads quickly to more interesting programs, and gives anyone who uses it a complete knowledge of Applesoft BASIC. Lively illustrations, notes to parents and teachers and questions for the reader are sprinkled throughout the book. While this guide is aimed at 8-16 year olds, adults will find it equally attractive as a beginning book for use the Apple personal computer! BK1253 $19.95

SOME COMMON BASIC PROGRAMS, APPLE II EDITION—By Lon Poole et al. A powerful collection of financial, statistical, home management and mathematics programs—76 in all. Each program is presented with BASIC source code, operating instructions and descriptions. If you're a beginning programmer you can learn from this book what well designed and documented programs look like. BK1232 **$16.95**

THE CUSTOM APPLE AND OTHER MYSTERIES—by Winifred Hofacker and Ekkehard Floegel. This is *the* guide to customizing Apple software and hardware, published by the folks at IJG. It contains such hands-on information such as: data acquisition and control applications, Programming the 6522 Internal timer, Constructing the 6522 I/O board, An Eprom Burner for the Apple Computer, An Eprom/RAM board, The Apple Slot Repeater, and much, much more. BK1246 $24.95.

APPLE MACHINE LANGUAGE—by Don Inman and Kurt Inman. APPLE MACHINE LANGUAGE builds upon your previous knowledge of BASIC, and teaches you the machine language in small, easy, completely illustrated steps. Following this guide, you will be able to write machine language programs directly, using the Apple System Monitor. Each new program is thoroughly presented in functional blocks, with sketches of how each step will actually appear on the video screen. Soon you will be entering and executing your own machine language programs, with predictable results! BK1248 $14.95

Axlon Ramdisk 320

The Axlon Ramdisk 320 looks like an Apple disk drive in style, size and color. When you first see this unit your reaction is, "Where is the slot for the disk?" The only things visible on the front of it are a few little lights. But packed in the case is 320K of RAM, a power supply and a battery.

Hardware Description

The system is built to appear like two floppy disk drives operating from the same slot. In Basic, they would look like drive 1 and drive 2. In Pascal they can be volume numbers 4 and 5, 9 and 10 or 11 and 12. Each drive looks like 35 tracks with 16 sectors per track and 256 bytes per sector, just like the real thing. There are really 40 tracks available but you have to use some tricks to get to it. I understand that 80 tracks are available under CP/M.

Inside the box are forty 64K RAM chips giving a total capacity of 327,680 bytes. A built-in battery backup system protects the memory in the box from blackout or brownout conditions for up to three hours. The system requires no power from the Apple. The Ramdisk has its own power supply and line cord. The battery is automatically recharged from the built-in power supply while the Ramdisk is turned on. There is a light on the front of the unit to show when the battery is charging.

An interface card is used to connect the Ramdisk to the Apple. This card contains the controller chips that are used to produce timing and refresh signals. A static RAM is used as a partial storage location for the Ramdisk operating system. The interface card can work in any slot other than zero. This interface card gets its power from the Ramdisk, not the Apple. This is a big advantage for those who have a stuffed Apple. The power dissipation is very low, helping to keep the temperature down in the core of the Apple.

The Ramdisk 320 from Axlon Inc.

Operation

The Ramdisk is designed to work with Apple DOS 3.3, Apple Pascal 1.1 and CP/M simulating standard disk drives. The only difference you'll notice is the greatly increased speed in comparison with standard mechanical drives. You can boot from the Ramdisk using the PR# command, or, if the interface card is installed in a slot above the mechanical drive interface, the system will boot directly from the Ramdisk when the Apple's power is applied.

Once the system was installed, I found that all DOS commands worked exactly like they always did with one difference—speed! In an effort to illustrate this speed, I timed some DOS functions using a stopwatch. The results are in the Table.

At first glance it does not look like there is a great increase in speed. You have to experience it to really understand its speed. Since it is not a mechanical unit, it is even faster than a hard disk.

Software

Included with the system is a utility disk with a number of programs in Basic and machine language. Another utility disk is included for Pascal. One of the greatest benefits of this system is its ability to rapidly assemble and compile Pascal code. I understand WordStar becomes a completely different environment with this system because of the fast disk accesses.

The programs on the Basic utility disk are more extensive. There is a program to reconfigure the system to any slot. There is a fast copy program that will copy the Ramdisk memory onto your mechanical drive disk or vice-versa. And there is a machine language program that allows you to

FUNCTION	AXLON	STD
Assemble 68 sector source using BIG.MAC	232 sec.	285 sec.
BLOAD graphic screen	2.7 sec.	9.9 sec.
BRUN 144 sector program	12 sec.	37 sec.

Table 1. Results of the DOS functions speed test.

Desktop Accountant™

FULL-FEATURE, FULLY-INTEGRATED ACCOUNTING SYSTEM

Everything you need to keep the books...at a price you can afford!

Your Bookkeeper, Accountant, and Banker will love you for installing this fine system!

Check these features:

This remarkably-valued Accounting System will manage your company's business records and **automate your entire bookkeeping process**—from the posting of individual transactions to producing up-to-the-minute Income Statements, Balance Sheets, and other important management reports. Desktop Accountant™ gives you a "Big Company," professional image with **printed** invoices, statements, and checks. It is **user-friendly, completely menu-driven,** offers **system-prompted data entry,** and is compatible with both floppy and hard disks. Feature-for-feature, and dollar-for-dollar it is **the best software value on the market!** But don't let the **low price** fool you. Desktop Accountant™ is **not a "cheap" accounting system, only inexpensive.** That's because original development costs were recovered years ago allowing us to sell **an excellent product** in high volume at low prices and still earn a fair profit. This **high-quality, reliable software** was designed and written in 1975 for small-to-medium sized businesses. Since then, **it has successfully proven itself in well over 10,000 companies** in all 50 states and in 13 foreign countries. It is also used and recommended by **hundreds** of bookkeepers, accountants and CPA's, including the regional offices of several famous "Big Eight" accounting firms! No other Accounting System offers you so many features, benefits, and valuable extra services. You can pay more but you can't buy more! Desktop Accountant™ is backed by our 30-day, no-risk, **money-back guarantee** of 100% customer satisfaction! Call for **free literature** or order now with complete confidence.

Read What Users Say...

"Two hours after receiving the Desktop Accountant I was up and running live data, and generated an entire month's work and financial statements the following day."

—J.C. Bartels, President
(accounting firm) Gonzales, Texas

"To get anything better we would have had to spend multiple thousands of dollars. I think it's a dynamite package for the money."

—Bob Cox, V.P. General Mgr. *LETTERS ON FILE*
(manufacturing company) San Antonio, Texas

Here's what you get:

1. A professional-quality, full-feature, fully-integrated accounting system. **2.** Six-to-fourteen diskettes (depending on your system's disk storage capacity). **3.** Four easy-to-follow, self-teaching User's Manuals (over 540 pages!) that are **highly rated by satisfied users. 4.** An exclusive, new **audio cassette tape** with **step-by-step instructions** for quick installation and start-up. **5.** "Read Me First" a unique 40-page system guide and start-up aid. **6. Complete sample data and sample reports** for practice and training...a big help to new users. **7. FREE 1-year subscription to Users' Newsletter,** "Debits and Credits." It's full of tips, ideas, news, and useful suggestions from us and other users. Recent issues have run over 20 pages long! **8. FREE complete Source Code** in popular MBASIC so you can easily customize *any* program to suit your special needs. **9.** Telephone "Hot Line" service for helpful Installation support, Start-up support, Technical support, and Training support. The quality of our cheerful customer support has been acclaimed **"excellent," "first-rate,"** and **"very courteous and professional"** by our users. **10.** Access to our growing network of **Experienced User Consultants**™ in both the U.S. and Canada. These qualified, knowledgeable businesspeople themselves own this fine software and are available to assist you with almost any aspect of installation, training, operation—or even customization, if desired. You'll receive the latest **Directory** of these helpful Consultants.

Look who's using it:

Here is a sample (taken from our customer files) of the wide variety of businesses successfully using this time-tested, solidly-established, user-proven software:

• Bookeeping services • CPA/Accounting firms • Construction companies • Wholesale Florists • Retail Florists • Printers • Insurance Agencies • Shopping Centers • Machine Shops • Engineering firms • Software Companies • Computer retailers • Publishers • Financial services companies • Investors • Appliance service firms • Dairies • Boilerworks • University Business School • Catholic Diocese • Baptist Ministeries • Sail Maker • Convalescent Hospital • Car Wash • Public Library • Cement Plant • Industrial products manufacturing companies • Mortuary • Coal Company • TV/Film producers and distributors • General Store (in Alaska!) • Health services organization • Government Agencies • Record and Tape stores • Trade Association • Graphics firms • Office products companies • Real Estate firms • Oil Products distributor • Instrument Company • Hydraulic Products company • Outdoor Expeditions company • Many types of schools • Chiropractors • Physicians • Landscapers • Law firms • Restaurants • Plumbing Companies • Railroad • Farmers • Banks • Consultants • and many, many, more!!

A Complete System!

includes all four standard general accounting programs:

GENERAL LEDGER is completely integrated to automatically post end-of-month transactions from A/R, A/P and Payroll. It **prints 13 detailed reports** for the entire company, and optional **Income Statements for up to 99 departments.** It produces up-to-the-minute **comparative financial statements** with current, year-to-date, budget, and last year (month and YTD), showing **both dollar amounts and percentages,** and presents everything you, your bookkeeper, and your accountant need to know about the company • G/L **automatically reconciles all accounts,** and maintains extensive, **detailed audit trails** showing the source of each G/L entry for quick, easy, tracing • Trial Balance includes all transactions • **Flexible Chart of Accounts** • True double-entry bookkeeping • Master File capacity: 400 Accounts • Monthly Transactions capacity: 1,000 with 200K diskette; 3,500 with 500K diskette; 7,000 per Megabyte with a Hard Disk.

ACCOUNTS RECEIVABLE provides **instant, on-line customer account information (both current and aged),** with complete, timely invoicing, including open-item (or balance forward) and statement capabilities. It makes the entire billing process fast, easy, and efficient. It quickly identifies your overdue accounts, **helps speed collections,** helps control your cash flow, and assists you in making better financial decisions. Both detailed and summary **customer activity and aging reports** are instantly available • Preprinted forms available for **invoices and statements** • **Detailed audit trail** • Maintains comprehensive customer data files • **Produces 8 reports and documents** • Includes automatic periodic customer/client billing option which is ideal for service businesses • **Itemized monthly transactions** • Master File capacity: 400 Customers • Monthly Transactions capacity: 800 with 200K diskette; 3,500 with 500K diskette; 7,000 per Megabyte with a Hard Disk.

ACCOUNTS PAYABLE maintains complete vendor/voucher history and includes **check-writing** capabilities. **Current and aged payable reports** are available upon command. It prepares an extremely useful **cash flow/cash requirements report** that greatly improves management control of your most valuable resource—cash! It prints checks (on commercially available forms on which **your company name, address and logo can be imprinted)** with comprehensive check stubs that your vendors will appreciate • **Produces 11 reports and documents** • Automatic pay selection program allows payment by due date or by discount date • **Manual and automatic checkwriting** • Check register • **Detailed audit trail** • Itemized monthly transactions • Master File capacity: 400 Vendors • Monthly Transactions capacity: 800 with 200K diskette; 3,500 with 500K diskette; 7,000 per Megabyte with a Hard Disk.

PAYROLL is a complete, **easy-to-use** professional-quality payroll system. Be the office hero each week when the checks come out on time! This program **calculates payroll for every type of employee** (hourly, salaried, and commissioned) and **prints payroll checks** (with popular, comprehensive check stubs) with an absolute **minimum** of input. **Your company name and logo** can appear on these, too. • Stores and reports comprehensive employee and payroll information. • Maintains monthly, quarterly, and yearly totals for reporting purposes in **multiple states**(!) • Offers **user-maintainable Federal, State, and local tax tables**(!). • W-2 printing • 941 Reporting • **Produces 10 reports and documents** • Master File capacity: 400 employees. An **outstanding** Payroll package!

Produces 42 Reports & Documents:

General Ledger **1.** Chart of Accounts **2.** Chart of Accounts with summary dollar amounts **3.** Chart of Accounts with prior year comparisons **4.** Daily Transactions Report **5.** Itemized Monthly Transactions **6.** Balance Sheet **7.** Balance Sheet with prior year comparison **8.** Income Statement **9.** Income Statement with prior year comparison **10.** Departmental Income Statement(s) **11.** Departmental Income Statement(s) with prior year comparison **12.** Detail report for individual accounts **13.** Trial Balance Statement

Accounts Receivable **1.** Daily Transactions Report **2.** Invoices (with or without preprinted forms) **3.** Statements (with or without pre-printed forms) **4.** Summary Aging Report **5.** Detailed Aging Report **6.** Itemized Monthly Transactions **7.** Detailed Customer Activity Report **8.** Summary Customer Account Report

Accounts Payable **1.** Daily Voucher Report **2.** Daily Credit Report **3.** Checks with Detailed stubs **4.** Check Register **5.** General Ledger Transfer Report **6.** Cash Requirements Report **7.** Transaction Register **8.** Open Voucher Report **9.** Aged Payables Report **10.** Detailed Vendor Activity Report **11.** Summary Vendor Account Report

Payroll **1.** Federal Tax Tables **2.** State Tax Tables **3.** Payroll checks with stubs **4.** Payroll Check Register **5.** Monthly Payroll Summary **6.** Quarterly Payroll Summary **7.** General Ledger Transfer Report **8.** Detailed Employee File Listing **9.** Produces 941 Worksheet **10.** Prints annual W-2 Forms

System Requirements: Either CP/M® or MS-DOS (PC-DOS) • Microsoft BASIC • 64K RAM • Two disk drives or hard disk • 132 column wide carriage printer, *or* an 8½"x11" printer with compressed print mode (an Epson MX-80 or similar printer).

100% SATISFACTION GUARANTEE

No-Risk, 30-day Money-Back Guarantee

Order Desktop Accountant and evaluate it yourself for 30 days. Test the performance of each program using our comprehensive *Sample Data Files* to enter and process data, query accounts, print checks and reports, and more. Review the five User's Manuals, hear the Training Tape, read the users' Newsletter, even call our Technical Support Group with your questions. ***You must be completely satisfied*** with Desktop Accountant or you may return it in good condition *with the Sealed Master Disk UNOPENED* (it installs *your* live data) for a prompt, courteous, complete refund!

*Call for **FREE LITERATURE**, including sample reports, comparison chart, user letters, etc.*

use the extra 40 tracks—but not as disk space. The source code for this and other routines are in the manual.

Two programs included on the Basic utility disk are worthy of special mention. Many times a new gadget is sold with a well-written manual. But you can't grasp how to use this new accessory until you see some good examples. Axlon provides two excellent examples of how to use the Ramdisk to full advantage.

The first program is called The Directory. It offers a limited information retrieval system for a medium to large company. It can be used effectively in an office lobby as a reference tool for the company receptionist or telephone operator. With a few simple keystrokes, the user can quickly find any piece of information in The Directory's 3248 records. It also contains an editor to input information.

The other program is called Mini-Base Phone Book, an Applesoft information retrieval system similar to The Directory. This system can handle approximately 200 records in a single file with up to five files on a single Ramdisk or disk. The Mini-Base is actually several programs. The noteworthy item about this program is its use of special machine language subroutines. They include a special keyboard input routine that acts as a combination Get/Input routine. The Get/Input combination allows the program to read the keyboard looking for the escape or return key as the first key press simulating a Get statement, and then handles the remaining key presses as an Input statement.

Another routine is a text file Fast Loader routine. It greatly speeds up loading text files with a few restrictions. But it can be a very useful routine.

Finally, there is a Fast Sort routine. You can sort a list of information that is read using the Fast Loader routine described above. This routine is designed to sort variables in ascending order by ASCII code. All of these routines are called using the & vector.

"With a few simple keystrokes the user can quickly find any piece of information."

The Manual

The manual is actually three manuals in one. There is a manual for the Ramdisk, the Directory program and the Mini-Base Phone Book. It is written for someone who knows a little something about the Apple II.

Included in the manual are some assembly language listings to do such things as clear sectors, read a sector, and access the extra memory in the Ramdisk not accessible from DOS. Also included are memory locations for many routines in the modified DOS. Methods are shown for accessing the Ramdisk from assembly language routines of your own design.

There is a problem with the Ramdisk: you must use the DOS as modified by the Ramdisk utilities. Other modifications and protected software will not work with this system.

However, if you are looking for very high speed and compatibility with standard DOS 3.3, Pascal 1.1 and CP/M, then you may have a winner. It is priced between two Disk II's and a hard disk, which is right where its capabilities lie.

The Ramdisk is available from Axlon Inc., 170 N. Wolf Road, Sunnyvale, CA 94086, for $1395. ■

F-10 Printer

I was impressed the minute I laid eyes on it. For those of us accustomed to the likes of popular dot matrix printers, such as Epsons and Okidatas, the size and heft of the C. Itoh Printmaster F-10 is a bit startling at first. Weighing nearly 31 pounds, it makes my Apple seem diminutive. You get the feeling that the computer is an accessory for the printer, rather than the other way around.

But with the impressive heft comes impressive performance. The F-10, first of all, is a daisywheel printer. That means it's in a different league than the more popular (and less expensive) dot matrix printers.

A dot matrix printer creates a character on paper by printing a dense pattern of dots. A daisywheel printer uses a completely different approach: it prints each character fully formed, in a single blow. The characters are molded in plastic or metal at the ends of thin, flexible petals on the daisy-shaped printing element. As this daisywheel spins, a tiny hammer strikes one of the petals at just the right moment to print the desired character on the paper.

This technique has the potential to produce print quality you simply can't match with a dot matrix printer. I am happy to report that the F-10 lives up to that potential. Its output is indistinguishable from that of an office electric typewriter.

The Printmaster is the faster of the two F-10 models and is rated at 55 characters per second. It takes just one minute to print a normal page of single-spaced text with a maximum line length of 60 characters.

Features

But fast, "plain vanilla" printing is not the only capability of the F-10. Here are some of its many features, all programmable through codes sent to the printer by the computer:

- Horizontal and verticle tab stops—both absolute and relative.
- Forms control (programmable patterns of vertical tab stops that make it easy to use all kinds of preprinted forms).
- Line spacing from 1/48 inch to about 3⅓ inches.
- Horizontal character spacing from 1/120 inch to about 1⅓ inches.
- Settings for left margin and form length.
- Half linefeed up or down (convenient for superscripting and subscripting).

ES-CAPE will set your creativity free!

ES-CAPE will help you **develop, enter, and modify** Applesoft programs. Even if you are only copying a program from a magazine, **ES-CAPE** will help you do it **three times faster!**

Visualize this: by pressing just a key or two, you can...

- **See** the disk catalog, **select** a program, and **load** it into memory.
- **Browse** through the program a screen or a line at a time.
- **Edit** lines using powerful commands like the word processors have: insert, delete, truncate, overtype, scan to beginning or end or to a particular character, and more.
- **See the values** of the variables used by your Applesoft program as it ran.
- **Save** the modified program. **ES-CAPE** *remembers the file name* for you!

ES-CAPE is easy to learn and use!

- Well-written User Manual guides you through the learning process.
- Handy Quick Reference Card reminds you of all features and commands.
- Built-in help screens and menus refresh your memory. You don't have to memorize anything!
- **The disk is NOT protected!** You can put **ES-CAPE** on every disk you own, and make as many backup copies as you need.

ES-CAPE will speed up and simplify your Applesoft programming!

- Choose a starting value and step size for **automatic line numbering.**
- Swiftly find all references to a given variable, line number, or any other sequence of characters.
- Quickly and automatically scan your program for any sequence of characters and replace them with a new spelling.
- Enter commonly used words or phrases with a single keystroke. A full set of pre-defined macros is provided, which you may modify as you wish.
- Display a DOS Command Menu with a single keystroke. A second keystroke selects CATALOG, LOAD, SAVE, and other common DOS commands. You can easily manage a disk-full of programs!

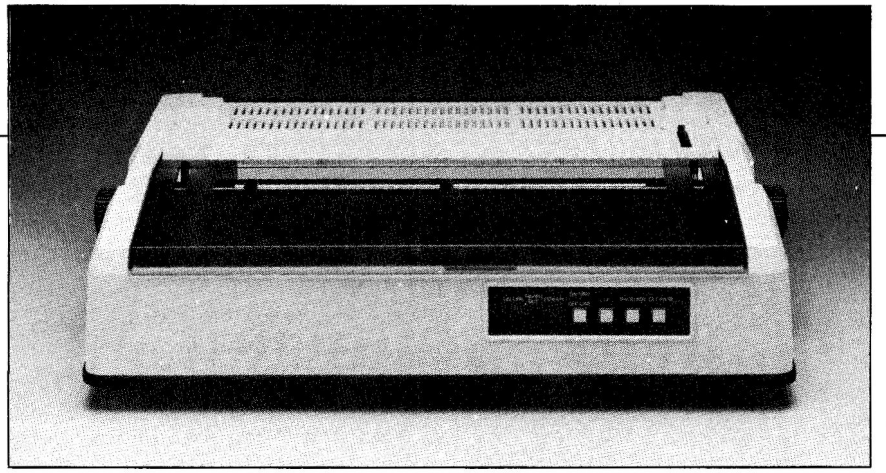

ES-CAPE is available now at many fine computer stores, or directly from S-C Software Corporation. The price is only $60.

Professional Apple Software Since 1978

Visa, MasterCard, American Express, COD accepted.

Apple is a trademark of Apple Computer Inc

The F-10 daisywheel printer from C. Itoh and Company Inc.

- Software reset to the settings in effect when the printer was powered on (convenient when you've been doing all kinds of crazy things such as the above and want to get back to plain vanilla printing).

- An optional word processing mode (not on the model I tested) offering proportional spacing, automatic underscoring, bold printing and shadow printing.
- A graphics mode with a density of either 60 or 120 dots per inch horizontally and 48 dots per inch vertically.
- Variable hammer striking force for each character.
- Optional printwheel control for nonstandard printwheels (programmable character address, impact force, and proportional spacing pitch).

Hardware options include either serial (RS-232C) or parallel (Centronics) interfaces, and an optional paper sheet feeder mechanism for convenient printing of long documents.

Operation

The printer uses friction to feed paper through its maws. (If there is a tractor-feed option available, there was no mention of it in the manual I received.) The feeding seems quite reliable, although continuous lengths of paper eventually get off track after several pages have gone through.

Changing the ribbon is simplicity itself. The ribbon is contained in a cartridge that can be popped out and reinstalled in less than ten seconds. The daisywheel, likewise, is simple and straightforward to replace.

It's hard to find fault with the capabilities and performance of this printer. Like other daisywheel printers, it is fairly noisy. However, the pitch of the noise is less piercing than a typical dot matrix printer. The cooling fan generates a continuous windy sound as long as the printer is powered up. I can't report on the printer's longterm reliability, but I can say that it printed several hundred flawless pages for me during several weeks of testing.

Documentation

As hard as it is to find anything bad to say about the printer, it's even harder to find anything good to say about its documentation.

The user's manual accompanying the F-10 is awful. Although it does contain quite a bit of the information, it is presented neither in a logical nor clear manner.

Part of the problem is summed up by the legend on the back cover of the manual: "Printed in Japan". Awkard English phrasing is the last thing you need when trying to learn how to use such a sophisticated device.

One problem I had was trying to unravel the manner in which the manual uses the terms "serial", "par-

Circle 108 on Reader Service card.

WHAT ARE YOU WAITING FOR???

Are you tired of waiting for DOS to load and save files? Are you tired of waiting for DOS to finish so you can type again? Are you tired of waiting for your printer? When you buy **Diversi-DOS™**, you won't have to wait any more! Here's why:

1. DOS speed-up: Apple DOS 3.3 takes 18 disk revolutions to read a single track, whereas **Diversi-DOS** reads or writes a track in just 2 revolutions. This speeds up file processing tremendously (see table).

2. Keyboard Buffer: **Diversi-DOS** allows you to type at any time, as fast as you can, without missing a single character.

3. Print Buffer: **Diversi-DOS** can use a RAM card (16K-128K) to temporarily save characters before they are printed. Thus, your computer won't have to wait for your printer to finish.

4. DDMOVER: **Diversi-DOS** can now be moved to a RAM card for increased memory with BASIC programs.

	APPLE DOS	DIVERSI-DOS
SAVE ‡	27.1 sec.	5.9 sec.
LOAD ‡	19.2 sec.	4.5 sec.
BSAVE*	13.6 sec.	4.1 sec.
BLOAD*	9.5 sec.	2.6 sec.
READ**	42.2 sec.	12.4 sec.
WRITE**	44.6 sec.	14.9 sec.
APPEND**	21.3 sec.	2.3 sec.

* Hi-res screen ‡ 80-sector BASIC program
** 52-sector text file

Diversi-DOS, the QUADRUPLE utility, requires a 48K Apple II or II+ with DOS 3.3. A simple, menu-driven installation program is included on the un-protected disk. So what are you waiting for?

Coming Soon: Diversi-Writer™

allel" and "line." The printer can use either a serial or parallel interface, but it never really clearly conveyed that fact. The manual also said (in so many words, this time) that "both serial and line modes are switch-selectable." My conclusion? Parallel and line mean the same thing, and both interfaces are available at the touch of a switch.

I finally figured out that is not the case. Serial mode has nothing to do with the type of interface between the printer and computer. With either a serial or parallel interface, you can operate the printer in either serial or line mode.

Another example of the problems with poor documentation is my experience using the F-10's graphics mode. Naturally, I wasn't expecting great graphics with a daisywheel printer. Still, it was nice to know there was a graphics mode capable of printing up to 120 by 48 dots per square inch. That could really go a long way toward dumping a hi-res picture. Even I could probably write a little routine, in Basic, to do the trick.

"Serial mode has nothing to do with the type of interface between the printer and computer."

Unfortunately, after learning everything the manual has to say about this graphics mode, I still have only the vaguest idea how to use it. The best I've been able to do is print a couple hundred periods next to each other in a solid line a few inches long. Is it possible to do more without a special interface card or driver? I'll never find out by reading the manual. There's not a word written on how one would actually use this mode.

In summary, the C. Itoh F-10 is a terrific printer with a lousy manual. If you need high-quality printout, you should seriously consider the F-10. However, this recommendation is conditional. If you have sufficient technical knowledge already, the user-hostile documentation probably won't bother you very much. But if you need to learn how to use the printer's features, be sure to buy it from someone who knows it inside out and will give you the needed support from day one.

For more information on the Printmaster, contact C. Itoh & Co., Inc., 5301 Beethoven Street, Los Angeles, CA 90066. It retails for $1995.00. ■

THUNDERCLOCK PLUS™

Supported by the best names in the business

Many of the best hardware and software products on the market today are compatible with Thunderclock Plus. By design. Because Thunderclock Plus makes them much more versatile.

Just plug Thunderclock Plus into your Apple® II, IIe or III and it can do any number of tasks automatically. In the office, the lab or at home. For instance, with business or communications software, your Apple can access a data base or send electronic mail when the rates are lowest.

Thunderclock Plus can also time and date stamp your disk files to the minute,* time experiments and even water your lawn.** But that's just the start. No matter how you use your system now, it can work much more efficiently with Thunderclock Plus.

Thunderclock Plus comes with a one-year warranty. On-board batteries keep it running accurately for up to four years without battery replacement.

If you want the convenience and versatility of running your system around the clock, get the clock it's designed to run around. Thunderclock Plus. Supported by the best names in the business.

See your dealer for a demonstration or contact us.

READER SERVICE

My vote for the best advertisement in this issue goes to_____(company) whose Reader Service number is_____.

A. Where did you obtain this copy of *inCider*?
- ☐1. Subscription
- ☐2. Newsstand
- ☐3. Computer store
- ☐4. Bookstore
- ☐5. School
- ☐6. Library
- ☐7. Friend
- ☐8. Other_____

B. Do you use an Apple at your place of work?
- ☐1. Yes
- ☐2. No

C. Do you have any influence over the use or purchase of computer equipment for your company?
- ☐1. Yes
- ☐2. No

D. How do you acquire most of your software?
- ☐1. From software houses
- ☐2. Program it yourself
- ☐3. From magazines
- ☐4. From friends and fellow programmers
- ☐5. Copy it

E. How much have you spent on software during the last 12 months?
- ☐1. Nothing
- ☐2. Less than $100
- ☐3. $100-$250
- ☐4. $250-$500
- ☐5. $500-$1,000
- ☐6. Over $1,000

F. On average, how many of the program listings in each issue of *inCider* do you actually type in?
- ☐1. 0
- ☐2. 1
- ☐3. 2
- ☐4. 3 or more

G. If you don't enter programs, why not?
- ☐1. Don't apply to my system
- ☐2. Listing too long
- ☐3. Not useful
- ☐4. Not interesting
- ☐5. Other_____

H. What types of programs published in magazines do you type in?
- ☐1. Business
- ☐2. Games
- ☐3. Utilities
- ☐4. Education
- ☐5. Graphics
- ☐6. Hobby
- ☐7. Home Finance/Management
- ☐8. Other_____

I. What microcomputers do you personally own?
- ☐1. Apple II or II+
- ☐2. Apple III
- ☐3. Apple IIe
- ☐4. Lisa
- ☐5. Apple-compatible
- ☐6. Other_____
- ☐7. Don't own one

J. What type of printer do you own?
- ☐1. Dot matrix
- ☐2. Letter quality
- ☐3. Ink jet
- ☐4. Other_____
- ☐5. Don't own a printer

K. On a scale of 1 (no interest) to 5 (great interest), please rate your interest in the following types of articles:
- ___1. Editorials
- ___2. Tutorials
- ___3. Industry interviews
- ___4. Reviews
- ___5. Humor
- ___6. New Products
- ___7. Hardware construction
- ___8. Software modification
- ___9. Programming techniques
- ___10. Application programs
- ___11. Networking articles
- ___12. Telecomputing articles

PROFIT FROM THE PAST

Can you predict your company's next growth period? With **Business Cycle Analysis** you can. Plan ahead with confidence. Let your computer:

- record monthly data (productivity, net profit, operating expenses . . . whatever you like);
- calculate 12-month moving averages and pressure points at the touch of a button;
- create easy-to-read plots of raw data, averages, or pressure curves *in just seconds.*

Why risk your investment. Come out a winner with **Business Cycle Analysis**. Ideal for managers, sales & marketing analysts, investors, students, and small businesses. Apple II+*, 48K, Applesoft, disk, 0406AD, **$59.95**

**Apple is a registered trademark of Apple Computer Inc.*

Yes!. . . Send me_____copies of Business Cycle Analysis

OrganizeYourself

Find all your Apple* programs in seconds with **Disk Library.**

Add, change, or delete program names or disk titles. Verify information *before* it's deleted. Enter new data manually or direct from the disk.

Location & Library Dumps display all disk titles, or disk titles and program names. Includes printer option.

Search for programs alphabetically, by location, or by program name. Includes a similar-word search.

You can also delete the entire text file and reformat the disk. Or save everything with a single key-stroke. With **Disk Library** you'll never again waste hours looking for a program.

Apple II+, Applesoft, 32K, disk, 0374AD, $24.95.

CUSTOMIZE YOUR APPLE*

Tailor your Apple DOS 3.3 to your needs with **DOS Customizer**. This powerful utility upgrades your Apple while making it easier to use. Now you can alter DOS commands, load programs four times faster, and change error messages.

Redesign your disk catalog to use five columns. Add headers to show you the number of sectors available or the disk volume number. Add footers that'll give the total number of files and sectors in use. You can even add messages.

Control the Maxfiles default, the automatic reload of your language card, the BASIC DOS command prefix, and your greeting program.

Make your Apple uniquely yours with **DOS Customer.**
Apple II+, Applesoft, 48K, DOS 3.3, Two Disk Drives, 0440AD, **$24.95.**

Software Reviews

Early Games

Early Games by John Paulson of Early Games Company, Suite 140, Shelard Plaza North, Minneapolis, Minnesota, 55426, will appeal to the youngest, pre-reading computer user.

Early Games is a series of nine number, letter and shape matching games that concentrate on developing discrimination, counting and sorting skills. The games are colorful, evenly paced and varied and are very successful in holding the interest of preschool and kindergarten age children.

In the popular Draw program, the child constructs and saves a color picture of his/her own design. This enables even the youngest child to gain a sense of control over the computer while exercising his/her own creativity.

Initial adult assistance is necessary to introduce the child to the very simple mechanics of handling the menu and game play of Early Games. One 5¼-inch disk is included with an instruction/description manual in the Early Games package. The disk is guaranteed against defect for 30 days after purchase and retails for $29.95. ■

Mary Ingram
Brattleboro, VT

Epidemic

Epidemic is a complex single-player strategy game where you, as director of the Center for Disease Control, can stop various deadly viruses and save mankind.

This realistic scenario has meteorites crashing to earth with deadly alien viruses. As director, your mission is to contain and destroy an engulfing plague before it spreads and infects all 14 regions of the world. At your disposal are eight remedies to counter the disease in its early stages; four remedies to counter the disease in its pneumonic level; missiles to destory the meteorites while in the outer atmosphere; and nuclear detonation of a country when no other options are available.

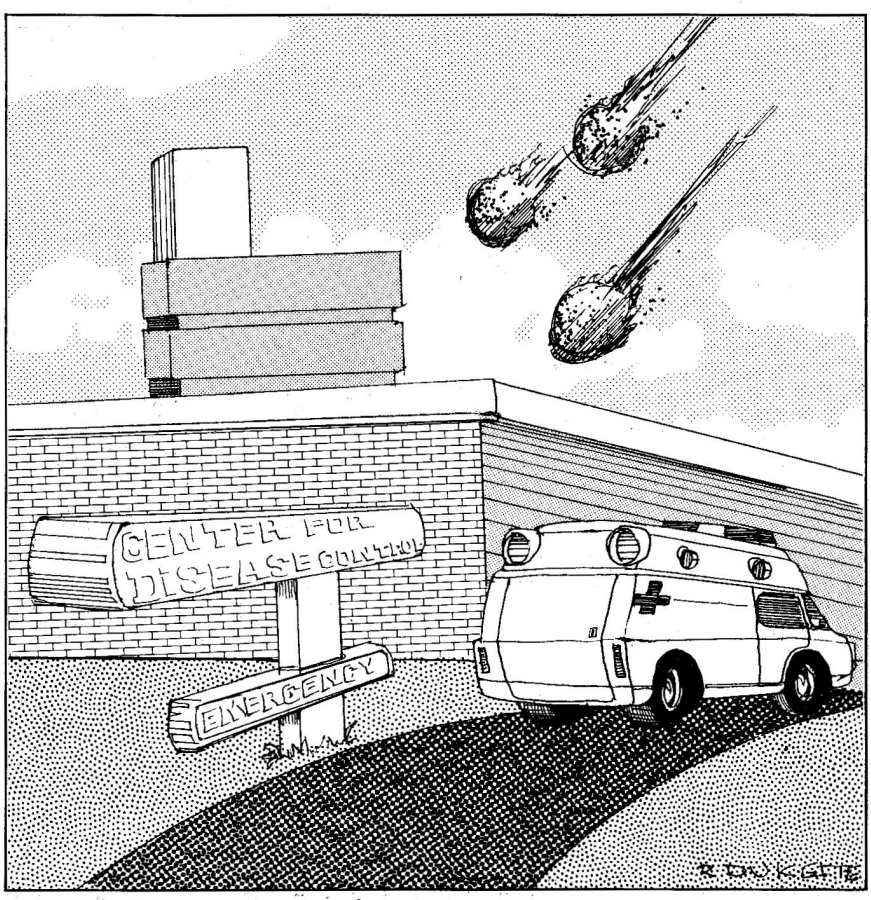

All decisions are implemented through the numerical portion of the keyboard. There are two graphics displays that assist your decision making process. One screen displays a statistical update of specific regions of interest, while the other screen displays the present global status.

The graphics in Epidemic are semi-dynamic and are reasonably well done. The statistical update is truly representative of the data a manager needs to make logical business decisions. The global status is updated each turn by reflecting the incoming meteorite's trajectory and impact data.

Unfortunately, frustration may tend to set in about halfway through the game. If you have a difficult time in handling and digesting data, the amount of dynamic data presented may cause confusion and lead to boredom. This is evident when you decide to use the nuclear detonation option and realize you missed the failsafe code word that was previously flashed on the screen during the statistical update sequence. At certain times, you are unable to logically proceed when remedies are not available. You then must go to the next day (next turn) in the adventure.

Understanding the capabilities of the remedies can be confusing at first. After applying the possibilities a few times, you eventually come to grips with the situation. Using these remedies does reflect the difficulties that a doctor or scientist must go through in a real crisis.

Beginners will find level 1 challenging, while old time players of strategy games will probably jump quickly to level 4. The main difference in the level of play is the amount of time available to defeat the disease. Each day is a turn, and the

Learn Financial Management Now...

Introducing the new IMI interactive learning course, *"Managerial Finance in Action."*

It is exactly what you need to put full financial data at your fingertips.

At last you can cut through the jargon of financial specialists, the same way as more than 50,000 business managers throughout the world have...with IMI.

And now, for the first time, you can learn their techniques...and develop important skills...at your own pace, in your own office or home, on your Apple Computer.

It's like having a friendly professor of financial management, sitting at your elbow, coaching you every step of the way.

Here's what this interactive computer-assisted course will teach you:

- The language of finance and accounting;
- How to interpret and use financial reports and statements;
- How to improve your business decisions and financial well-being;
- How to measure profit, evaluate your financial condition, and judge your business performance. (Where does the money come from, and where does it go?)
- How to communicate better with the financial specialists;
- And most important, HOW TO USE YOUR APPLE AS A FINANCIAL TOOL.

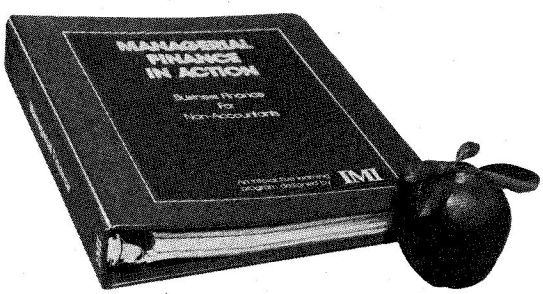

A series of audio cassettes explains and guides you through ten computer diskettes. Your Apple computer produces and controls text with complete graphics, makes computations with you, compares your exercises to the correct responses...and then patiently shows you how to make adjustments and corrections.

The program runs on Apple II+ 48K and Apple IIe personal computers.

To order "Managerial Finance in Action" see your local Apple or Software dealer. VISA or MasterCard owners call collect 201-522-1213, or use the coupon and enclose your check. Price is $375.00 U.S. Dollars plus $4.95 shipping.

With an Apple* for your teacher

YOU GET ALL THIS

Over 120 pages of text, exercises and work sheets
10 floppy 5¼" diskettes
5 audio tape cassettes
Customized 3-ring binder
90 day warranty

The International Management Institute, Inc.
300 Lost District Drive
New Canaan, CT 06840

Circle 135 on Reader Service card.

range of the levels is 15 to 30 days. The game ends in one of three ways: time runs out, the world is destroyed or the world is saved. Your success/failure rating is given at the end of the game; the rating is based on a scale of 0 to 1000.

Epidemic is not as action packed as the seek and destroy games. The strategy is difficult to master. The younger participants who take this adventure will probably find it to be too complicated. However, for the more experienced player, this game will initially be a challenge. The challenge may become stale, however, after a few games.

Epidemic is manufactured by Strategic Simulations Inc., 883 Stierlin Rd., Building A200, Mountain View, CA 94093. Price is $34.95. ■

Miner 2049er

Let me admit, at the outset, that I have demonstrated almost no skill in playing Miner 2049er. Despite my ineptitude at this game, I am forced to confess that Miner is one of the best arcade games available for the Apple II.

If you are familiar with coin games like Donkey Kong, you already have a good handle on the basic format of Miner. As the game begins, the hi-res color screen displays four floors of a futuristic mine. On the bottom floor is a courageous little fellow, Bounty Bob. Your job is to guide Bounty Bob as he climbs all four floors. To win he must defeat or evade the mutant monsters, grab assorted apple-shaped treasures and cover every step of all four mine floors (which will fill in with color as he passes by). As you start you're provided with three Bounty Bobs to accomplish the feat.

After a half hour of Miner you'll be timing your jumps perfectly, leaping over mutant monsters and gaps in the floor, and traveling the whole mine without a fatal accident.

The first level (of which I have a wonderful knowledge, having spent so much time there) is the easiest. All Bounty Bob has to do is evade four immobile mutants, climb some simple ladders, grab five treasures and jump one little gap in the floor.

So far, I have not acquired the skill which I have displayed in other arcade games. In Miner 2049er you have to bear down and concentrate or you'll never get past the first level. When my concentration wavers, I sometimes misjudge a jump and send Bounty Bob over the edge to his death.

During my occasional excursions into the second level, I discovered many more gaps in the floor, monsters at the very bottom level and slides that abruptly deposit Bounty Bob on the next to lowest floor. On this level it has been a grim struggle. On level three Bounty Bob can barely survive; and so far, I haven't demonstrated the skill to get him into any of the higher levels.

I have been, however, reliably informed that should I ever get beyond level three, Bounty Bob will discover moving platforms, stompers, radioactive pools and harder jumps. Also waiting for Bounty Bob will be various devices that can help him. If he acquires a taste for eating TNT, Bounty Bob can even make use of a cannon to shoot himself to the top of the tenth level.

Miner is designed for play with a joystick. I found control with a Joystick II to be smooth and accurate. If you are using this or any other Apple-compatible joystick that is not self centering, you must calibrate it, using a subroutine that comes with Miner. The documentation recommends an Atari-type, self-centering joystick. You can also use a Sirius joyport with Miner.

Miner 2049er displays a high level of technical quality. The graphics are good; they offer smooth animation, pleasing designs and interesting effects. The shapes representing the monsters and Bounty Bob are adequate for the purposes of play but are not overly exciting. Most importantly, Miner 2049er holds onto your interest.

The format of the game resembles that of Donkey Kong or Apple Panic, and the game offers an exceptionally high level of challenge. Despite the frequent frustrations you'll encounter, play and enjoyment values are high enough to keep you coming back for more.

Micro Fun, a division of Micro Lab, 2669 Skokie Valley Road, Highland Park, IL 60035, lists Miner 2049er at $40. The game can be run on any Apple II or IIe system with 48K memory, a disk drive and a joystick. Miner can be played by one or two players. ■

Fairfield, CT

Galactic Gladiators

How many games do you own that were once favorites and now somehow seem a little dull? If it only were possible to expand them a bit, to add a few variations for some new excitement. Galactic Gladiators is one of those rare games that allows you so many options—including designing your own game—that boredom is very unlikely.

The program is billed as a combat simulator. Two teams of your choosing engage in battle, often to the death. Teams are composed of warriors from other planets and, occasionally, monsters like banshees, mutants and slime devils. Combat occurs on the hi-res screen and is accompanied by text messages that explain who is attacking whom and how much damage has been done.

The Main Menu

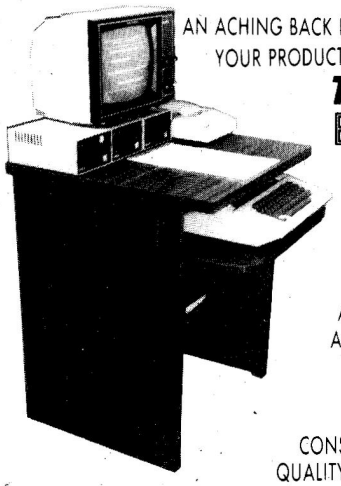

After booting the disk, you may (P)lay a new game, (R)estart an old game, (I)nitialize an SSI save disk, (C)atalog an SSI save disk, (D)elete an old team, battlefield, or game, or (V)iew species drawings. One of the many strengths of Galactic Gladiators is its provision for saving games in progress, teams you have created and game set-ups. For example, as a

team gains experience (through winning combats), the members become more adept at dodging attacks and directing their special weapons' fire. It is interesting to see how far they can progress by pitting them against successively more experienced teams.

The Submenus—Game Set-up

Once you have decided to play, you may select one of six possible scenarios: (1) Brawl at Cosmic Mike's Place, (2) In the Arena, (3) Hijack!, (4) Home World Combats, (5) Strange Places or (6) Create a Game. Each has its own permissible options. The higher the number, the greater the control over the set-up.

In Cosmic Mike's, you are introduced to the "standard" teams: lightweights, middleweights, heavyweights, armour team, phasor team, hand weapons and guided missiles team. As with all teams available in Galactic Gladiators, each has its special strengths and weaknesses. After selecting a team for each side, you indicate which team you would like to control. The Apple automatically guides the other team. If you like, you may even elect to captain both teams!

Next, you choose either a grid map or open map for the battlefield display. Since all movements are indicated by number (1–8 for each possible direction), the grid option makes it easier to see where you may move. The open map, however, adds realism to the game. Finally, team members are placed on the battlefield in two possible ways: (E)xperience rule or (C)hoose initial placement. With the former, the Apple places the men and, if one team is stronger, the weaker team is allowed to surprise the other by rearranging men and launching the first attack. With the latter option, you may place one team, both teams, or have placement generated randomly.

In the Arena, you are also allowed to choose the range of the combat—close, medium or long. In the close and medium options, players are represented by hi-res drawings during the combat. In long range, only the first letter of each character's name is displayed.

Hijack! adds two more options. First, teams can be all one species or mixed, and the game may be played until one team is eliminated or in defend mode. In the defend variation, one team selects a square which it elects to defend. The game continues until either team is destroyed or the attackers capture the defended square.

In Home World, you are introduced to seven standard species: Koraci, Cygnian, Human, Wodanite, Froglodyte, Dulbian and Zorcon. The team may contain three, five or seven gladiators. Team two may be an old team (from your save game disk), a regular species team, a special species team, an experienced standard species team, or a new team which you create from scratch. The special species are superior warriors and often possess unusual strength, dexterity, and/or endurance. Whereas the regular species typically have strength between 7 and 19, the special species vary on this characteristic from 10 to 99!

You may also vary the battlefield, choosing whether it is indoors or outdoors, created at random, one of seven standard battlefields, or originally designed. In designing the field, you may place full, half or partial blocks on as many squares as you like. The more complete the block, the less successful weapons will be in piercing it.

Strange Places is definitely a favorite of mine. Even the options have exciting names: Gorsai Free for All, Robot Maze, Touch of Death, Banshee Hunt, Attack of the Slime Devils, Night Stalkers and Gemstone Alley. Each option corresponds to a special species team. Generally, you

*Applesoft and Visicalc are Trade Marks respectively of Apple Computer, Inc. and Visicorp.

direct the opposing team of your own creation. After selecting the team (same options as in Home World), you may add gladiators up to a total of ten; delete gladiators (if the team is too strong, for example); change an individual member's weapons, armour, or name; and/or merge the team with another from your disk. The only limitation is that certain species travel alone (like the Banshees) or only one such creature (monsters) are allowed per team. If you want an extra exciting game, try Gorsai Free for All which pits two Gorsai teams against each other.

Weapons may be selected from an array of twelve. They include several kinds of close combat weapons (stun wand, laser sword, disruptor, slicer, etc.), two types of phasors, two types of guided missiles, and a heat ray gun (for melting obstacles). Each team member may carry two. Hand weapons require endurance to operate, guided weapons may only be used once, and phasors and heat ray guns must be reloaded after each shot. Each weapon also requires a specific player strength in order to possess it. Armour may be none, light, or heavy. In addition to the protection it affords, the member's dexterity and speed will be reduced according to the armour's density.

Finally, Create a Game lets you control all of the options described above! This mode is especially useful in creating quests—a series of combats with predesignated goals and opponents. Win the first and move your men into a second contest, perhaps allowing them to rearm themselves and take on replacements for the dead or wounded.

The Play

At each turn, you must choose from the main options: (S)urrender, (M)ode, (Q)uit/save, (C)hoose, (R)eview, (E)nd options, (V)iew enemy and (P)rofile. The Mode option allows you to change teams that you control (from 1 to 2, or elect to control both). Thus, if you're losing badly, you can always change sides! Also, since the computer's men occasionally get trapped in a corridor, the Apple isn't always smart enough to find the way out. Profile displays the current status of any of your team members, what the weapon in hand is and if it is loaded, and the secondary weapon. View enemy lets you see similar information for members of the other team.

The Choose option is really the meat of the battle preparation. With it, you indicate what each combatant is to do on the next turn. You may load a weapon, change to the secondary weapon, rest (default), attack one opponent from your current position, move and attack, dodge and move, or fire a heat ray gun (destroys a single obstacle). Each member may perform only one of these per turn. If an individual is heavily stunned, he

may only rest and recuperate.

During play combatants move in checker-like fashion, hopping from square to square. If movement is blocked at any point, they remain in the last square occupied. Phasor fire is shown by a direct line zipping towards the target and is accompanied by a sizzling sound. If a combatant is hit in any attack, a flashing diamond is drawn over the character and the degree of damage is shown via text.

Evaluation

Galactic Gladiators, although not an arcade game, has enough action to keep even the most jaded computer warrior busy. As characters gain experience, they even seem to take on a personality. Because of the myriad of options provided, no two games are alike. Each is a new adventure and poses different challenges. It definitely has my endorsement! By the way, SSI will replace free any disk that proves defective within the 30 day warranty period. This turned out to be the case with my initial copy and SSI sent the replacement via Blue Label U.P.S.!

Galactic Gladiators is distributed by Strategic Simulations Inc., 883 Stierlin Rd., Building A200, Mountain View, CA 94043 as part of the Rapid-Fire line. Price is $39.95. ■

Steven Schwartz
Pittsburgh, PA

Pandemonium

A game with the name Pandemonium ought to be an action-packed arcade game. It is, however, more of an intellectual game, a game that will interest crossword puzzle or Scrabble fans.

The name refers to the increasing tension as you work under a time limit to build up your score!

In Pandemonium you have a 5-inch by 5-inch grid. You choose a time limit and mode of play, and one by one, letters are shown that must be placed in the grid. The letters are randomly generated; their frequency follows a table given in the game booklet, and their point values are inverse to their frequency. Word values depend on the letter values, on their placement in double or triple value squares and on word lengths.

In the simplest (but actually the hardest) level of play, it is simply guesswork trying to decide where letters should go. As the grid is filled, you hope for particular letters that will complete words.

Two options are available to spice up this basic game. One is to bypass letters that are too hard to use. You may only say no to five letters. Is it wise to pass up a high-value Q or Z, or can you use it to form some long words that will boost your score?

The second option is to rearrange the letters once the grid is filled in. High scores can be gained this way; it is actually the most challenging part of the game. The first part, filling in the grid, becomes a formality of exploring likely possibilities; but when it comes time to rearrange, you know what you have to work with, and there are no more unknowns entering the picture.

After the game has been scored, the same letter sequence can be replayed. If you bypassed the wrong letters, you can choose differently. Or again, you can replay the grid, swapping letters to see if you really did get the highest possible score.

For competition, it is suggested that stronger players be handicapped with a shorter time limit. This play might create something like the tension of a chess tournament, but certainly not that of a race, or even the thrill of a strike in Apple Bowling.

Rather than competition, though, Pandemonium allows for cooperative play or for playing against one's own high score. Team play can do much to strengthen cooperation and mental alertness. And aren't there already enough competitive games?

Pandemonium comes with a booklet that includes instructions, hints on strategy and the dictionaries that are built into the program. These seem to be quite complete for three, four and five letter words, but we did manage to find some missing words. The list does include enough obscure word to satisfy the average Scrabble player.

Pandemonium has its own fast DOS system and includes instructions for using it to initialize your own disks. I have tried it out, and it does speed up disk access.

Pandemonium might have its place in a school situation, possibly at the middle school level or higher. In playing with my 10-year-old, it was the rearrangement of the grid and not the original selection and placing of letters that held his interest.

Pandemonium is manufactured by Soft Images, 200 Rt. 17, Mahwah, NJ 07430. Price is $39.95. ■

Stellar Astronomy/Cosmology

Stellar Astronomy's six parts use interactive computer assisted instruction, magnificent graphics, and easily understood running-narrative text.

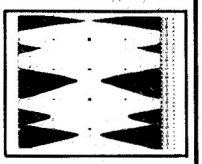

One part, "Types of Stars," presents a colorful, animated Hertzsrung-Russell diagram as the core around which luminosity types and the evolution of stars are discussed. Of the hundreds of educational programs I have examined in the last three years, "Types of Stars" is the best educational program I have ever seen.

"Galaxies" explains the origins and shows various types of galaxies. "Constellations" demonstrates the configurations of 30 galaxies while "Sirius and the White Dwarf" teaches about binary stars. "Death of a Star" and "Doppler Effect" cover their subjects with the same excellence characterizing all the previously described programs.

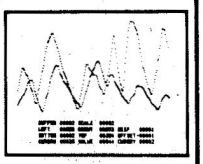

On the other side of the Stellar Astronomy disk is Cosmology. Excellent graphics and CAI methods char-

acterize its two parts. "Cosmology and the Origin of the Elements" presents a well-illustrated explanation of Hubble's Law, why the sky is dark, background microwave radiation, the Big Bang theory and other topics. An excellent explanation of stellar nucleosynthesis is included.

"Cosmology II" is written in a less scientific and more metaphysical manner. It presents ten different philosophical models for existence. Parts are unusually well done and entertaining. Section 3 on Theistic Existentialism shows God creating the universe and then walking off and leaving it. My only criticism is that section 1 on Genesis 1 fails to list among the many explanations the possibility the Biblical account may not be factually correct. Section 10 presents a well-done lesson for students on how drugs can blow one's mind. Students and teachers of philosophy will find Cosmology rewarding and thought provoking.

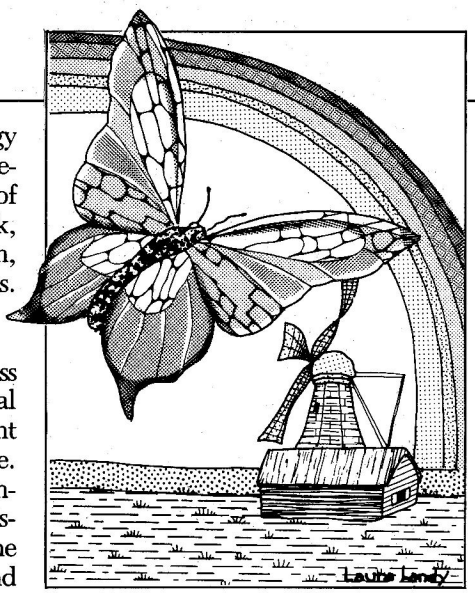

Stellar Astronomy and Cosmology are available on one disk from Cross Educational Software, P.O. Box 1536, Rustin, LA 71270 for $30. ■

Juggle's Rainbow

Juggle's Rainbow is a series of nested conceptual games developed by The Learning Company, 545 Middlefield Road, Suite 170, Menlo Park, CA 94025, for beginning and pre-readers, ages 3–6.

The three interrelated games, Butterfly, Windmill and Rainbow, develop concepts of above, below, left and right, while reinforcing the limited vocabulary of the menu and game instructions. The games encourage frequent responses and guarantee high interest through use of engaging graphics and lively music. Initial adult intervention is necessary to prepare the keyboard for game play. Juggle's Rainbow comes packaged in a colorful, plastic 5¼-inch disk

jacket cover, looking much like a small picture book. Printed documentation and parents' instructions are included with the package, which sells for $29.95. ■

Mary Ingram
Brattleboro, VT

Night Falls

Run for your lives! The aliens are attacking! And attack they do—over and over again, faster and faster. It's all a pseudo-city commander can do to keep up with them.

A force of robot invaders manning UFOs attacks the Earth en masse one day in Night Falls, levelling all the major cities. Discovering that traditional weapons are useless against the invaders, the humans head underground.

After scientists succeed in capturing and analyzing one of the alien weapons (a Twilight Maker), its secrets are used to build a defensive weapon (a gravity cannon) and create a city of towering structures. For some reason, the pseudo-cities infuriate the invaders, causing them to attack repeatedly until the city is destroyed. A number of cities are constructed to act as decoys. A commander is appointed to man the gravity gun in each of the phoney cities (from a safe distance, of course), and to hold off the aliens for as long as possible. In this manner, the remaining human population is able to maintain something of a "normal" life.

All action is controlled using a game paddle or a joystick. The game is based on cycles of night and day. During the day, all is peaceful and quiet. At night, however, the aliens attack! The object is to survive as many nights as possible before the invaders finally destroy the city.

The aliens have bombs and death rays at their disposal and they use both liberally in attempting to destroy the city. The bombs do little damage to the cityscape, but they do intercept your gravity cannon fire and protect the UFOs. The death rays, on the other hand, can obliterate from 1 to 9 levels of any building they strike. Just to make things a little more difficult, every fourth or fifth wave of aliens is invisible!

Your gravity cannon can be used to destroy invading ships and falling bombs. To help position the cannon, two positional cursors are provided: one at the top of the screen and one at the bottom. The former is useful in zeroing in on invaders and the latter helps avoid craters caused by the alien attack. A cannon fired from a crater automatically self-destructs, partially filling in the hole with its own mass. Cannons somehow take energy from each UFO they destroy and use it to rebuild the city each day.

If you manage to destroy all the invaders in a wave without letting any escape, you are rewarded with an immediate end to the night. If any are missed, however, day only comes when the bombs remaining on screen have fallen or are shot by your gravity cannon.

Your destruction occurs in one of two ways. Either the Cosmic Reactor that powers the city explodes (due to successful alien hits with bombs or death rays), or a strange entity known as a stellar vortex appears and detonates. Whenever the Cosmic Reactor is damaged, the core changes color and beeps to indicate that it is overheating. Options are provided for its repair or for adding new protection in the form of more towers above it. Stellar vortexes must build

to critical mass before detonation. The building process is indicated by changes in color and a ticking sound. Like the destruction of a UFO, shooting a stellar vortex also adds energy to the reactor—the closer to detonation, the greater the energy. If you jump the gun and shoot a stellar vortex prior to the ticking, energy is *deducted* from the reactor.

When each day dawns, you are awarded a number of units which can be used to rebuild the city. A suggested general strategy is to fill in all the craters (because of their danger to your gravity cannon) and to be sure that the reactor is well covered. At any time during the course of the game, you may freeze play and enter emergency stasis mode and use the energy points awarded so far that night to rebuild parts of the city. This is useful when the reactor has been breached by the invaders. An alternate and more drastic procedure allows you to rebuild the reactor. To do so requires that you have at least six cannons remaining.

Night Falls may be played at any of nine skill levels. At the higher levels, play is very fast, and completing even one day is difficult. If you manage to beat the existing record for a level, your initials and the new record are saved on the game disk. The sound may be toggled off or on at any time, according to the player's preference. Similarly, freezing play is also possible.

Unlike most other Apple arcade games, this one was written in Applesoft and compiled with Microsoft's TASC. It is provided on an unprotected disk. Thus, if you want to see how everything works, a simple List will do it for you. Instructions are also provided for using TASC to create modified versions of Night Falls.

The instructions for the game are fairly complex. I'm still not certain, for example, whether I should enter emergency stasis mode or rebuild the reactor after it has been hit. It is also easy to be overwhelmed by the number of informational items in the display. These difficulties aside, Night Falls is an excellent game. If it gets too simple at the lower levels of difficulty, one can always switch to a higher level. The sound effects are interesting, and if you have a color monitor, you'll be treated to a colorful light show. For those readers with black-and-white or green screen monitors, the lack of color does not hamper play in any way that I can detect.

Night Falls is sold for $29.95 by Omega Microware, Inc., 222 S. Riverside Plaza, Chicago IL 60606. It

Bag of Tricks

Bag of Tricks is a set of four utilities that are useful to the average computerist. You can examine the disk structure on disks (including copy protected ones), have control over the formatting structure of your disks, examine individual sectors on the disk, and repair many disks that are damaged and will not boot or have problem files.

The first utility is called Trax. Trax looks at the disk in terms of raw nibble data. It looks for address markers and checksums; and in most cases, it reports any abnormalities. It reads all but the most cryptic copy protected disks and also has a verify function that searches for nonstandard tracks. It then reports the data for that track.

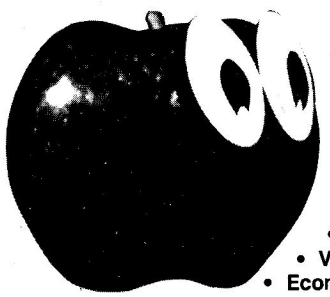

Zap, the second utility, is a disk sector editor that allows you to look at both the ASCII and hexadecimal contents of the sector. It lets you examine, edit, and rewrite any sector on a standard disk. This is an extremely useful function with a variety of uses. One might, for example, insert or change illegal file names, insert or delete illegal program line numbers or fix programs with garbaged line numbers

Init is a utility that initializes disks. You can also change the sector skewing so that your disks will read Basic and binary files more quickly than normal. This speed improvement is obtained with normal DOS. You don't have the problems with nonstandard DOS that many of the fast-load modifications give you.

The final utility, Fixcat, is a powerful and useful program that you can use to automatically fix blown DOS disks. You load the Fixcat program and insert the problem disk. The program gives you prompts which usually supply reasonable default values covering such questions as whether the disk has DOS or not. You simply press return through this series of questions and Fixcat begins to look at the catalog track (17 or hex 11). If there are problems on the catalog track, you are informed and asked if you wish Fixcat to repair them. After several inquiries into the catalog track, it reads each file.

The display shows each file along with its track sector list. A frequent condition is that the track sector count is wrong. Fixcat tells you that it

LET YOUR APPLE SEE THE WORLD!

The DS-65 Digisector® opens up a whole new world for your Apple II. Your computer can now be a part of the action, taking pictures to amuse your friends, watching your house while you're away, taking computer portraits . . . the applications abound! The DS-65 is a random access video digitizer. It converts a TV camera's output into digital information your computer can process. The DS-65 features:

- **High Resolution** — a 256 × 256 picture element scan
- **Precision** — 64 levels of grey scale
- **Versatility** — Accepts either NTSC or industrial video input
- **Economy** — A professional tool priced for the hobbyist

HI-RES PICTURE USING THE DS-65 AND PICTURE SCANNER SOFTWARE

The DS-65 is an intelligent peripheral card with on-board software in 2708 EPROM. Check these software features:

- Full screen scans directly to Apple Hi-Res screen
- Easy random access digitizing by Basic programs
- Line-scan digitizing for reading charts or tracking objects
- Utility functions for clearing and copying the Hi-Res screen

Use the DS-65 for precision security systems; computer portraiture; robotics; fast to slow scan conversion; moving target indicators; reading UPC codes, musical scores and paper tape and more! **GIVE YOUR APPLE THE GIFT OF SIGHT!** DS-65 Price: $349.95 / FSII Camera Price: $299.00 / Combination Price: $599.00

ADDITIONAL SOFTWARE FOR THE DS-65

—Picture Scanner: An applications tool for processing video images for display on the Hi-Res screen. A variety of dithering algorithms are provided, for compressing the digitized image into the Hi-Res screen and simulating grey scales. Price: $39.95

—Superscan: Enables you to enhance the DS-65's Hi-Res pictures with colors! Choose from 21 different colors and assign them to grey scale values, modify pictures, zoom, enhance contrast, etc. Includes print routines for Anadex 9500 or 9501; Epson MX-80GFT and MX-100; and IDS 460 Paper Tiger*. Written for The Micro Works by Magna Soft. Price: $79.95

*Paper Tiger is a trademark of Integral Data Systems, Inc.

is wrong and asks if you want to fix it. Pressing return fixes it. It then asks if you wish to search for lost or deleted files. If you answer yes, you get a fairly long (about 1 minute) search of the disk. If it finds a file, it shows you a sector of the file and asks if you want to retain the file. If you do want to retain it, you are given a chance to name it. If you don't name the file, it gets the name Unknown File #00 (or the next consecutive number) which follows the track sector list for that file.

Bag of Tricks does have some disadvantages. Trax will not read some copy-protected disks, and the information you get from it is rather cryptic. Fixcat will not fix a disk that has bad track sector pointers; if the pointer says to look for track FF sector 26, you will get an unrecoverable error. Zap has many features, but I find it somewhat complicated to use.

Bag of Tricks sells list for $39.95 and is manufactured by Quality Software, 6660 Reseda Blvd., Suite 105, Reseda, CA 91335. ■

Microbe

You read the book. You saw the movie. Now, you'll love the computer game. Microbe is based on the 1966 novel *Fantastic Voyage* by Dr. Isaac Asimov, which was made into a movie in 1969. The book and movie were good. The computer game is better.

From one to ten people may play; I recommend one to four. You begin by selecting your patient. Microbe gives you a good emergency room history, physical exam, and sophisticated lab studies. Next comes an exciting graphic miniaturization sequence in which you and your medical submarine shrink from life size to the size of a red blood cell to be injected into the patient's femoral vein.

From this point, I had a lot of trouble. I kept running out of air before getting very far in the vein. The author, Robert Clardy, came to my rescue by mail with tips that have since been added to the new edition of Microbe. To get more air, fuel and so on type I for inventory, select your item, and type U for use. This can be used to extend air and fuel tenfold. To steer the sub, center your second game paddle and use the keyboard arrows.

Microbe is not a game you sit down and play straight through the first time. First, you must study a general instruction manual, physician manual, navigator (anatomy) manual, and submarine technical manual. Try several practice runs. You must learn about anatomy, physiology, immunity, infection, and drugs to play Microbe. Your sub's on-board computer contains the information. Use the computer library to identify the blood elements you must shoot with the laser. To do this type <, 1, and select your item. The sub's library will give you good explanations.

I urge you to detour through the organs. The kidney comes first and gives you a chance to acquire an immune cloaking device. But don't get caught in the whirlpool glomerular filtration apparatus. I did and wound up in the bladder. That's bad, but not as bad as getting caught in the bile duct and ending up in the bowels. The liver supplies glycogen, your fuel. You can pick up more air in the lungs. You have 15 seconds to get through each heart valve and get the heart beating again. It will take practice, so expect to lose a few patients. By the way, I wish the authors would refer to the patients as patients and not victims.

If you make it to the brain, you have the chance to repair hemorrhages and aneurisms and to remove blood clots and tumors. Microbe is not perfect, but it is good. As a physician, I felt it was generally correct. Some concepts are hard to convey completely in this format. The graphics for the kidney are not anatomically correct, but they give some dynamic feel for what the kidney does. Microbe does not replace medical school, but it does let you play doctor.

Microbe is the first of a new wave of educational games. It is just as much of a challenge as Wizardry, but it is a much more constructive way for users to spend their time. I look forward to more Eduventures. Microbe would be an especially good purchase for schools with gifted programs. It is well-suited for young, gifted students.

Microbe requires an Apple II, II Plus or IIe with 48K of RAM and a disk drive. It is manufactured by Synergistic Software, 830 N. Riverside Drive, Suite 201, Renton, WA 98055. Price is $44.95. ■

Word Scrambler and Super Speller

Word Scrambler and Super Speller reinforce spelling skills by two different methods. The goal is to accumulate points and bonus points by spelling the words which are shown on the screen for a very short period of time. If you spell the word incorrectly, you must respell the word five times with the word shown on the screen plus one last time without the word being shown.

The optional scrambled word section allows three tries at unscrambling with a time limit on each try.

THE SELECTRIC™ INTERFACE

Daisy wheel quality without daisy wheel expense.

You need the quality print that a daisy wheel printer provides but the thought of buying one makes your wallet wilt. *The Selectric™ Interface*, a step-by-step guide to interfacing an IBM Selectric I/O Writer to your microcomputer, will give you that quality at a fraction of the price. George Young, co-author of *Microcomputing* magazine's popular "Kilobaud Klassroom" series, offers a low-cost alternative to buying a daisy wheel printer.

The Selectric™ Interface includes:

- step-by-step instructions
- tips on purchasing a used Selectric™
- information on various Selectric™ models, including the 2740, 2980, and Dura 1041
- driver software for Z80, 8080, and 6502 chips
- tips on interfacing techniques

With *The Selectric Interface* and some background in electronics, you can have a high-quality, low-cost, letter-quality printer. Petals not included.

APPLE II and APPLESOFT are registered trademarks of APPLE COMPUTER INC.

You may forfeit the word by pressing the escape key. The word will be shown to you if you are unsuccessful.

The program comes complete with three groups of words: K–3, 4–8 and expert.

The program allows you to create your own word files, view word files, add words to existing files and delete files. Large high-resolution characters are used in the scrambled word drill. The program lets you set the time for the flashing word and the time limit for the scrambler.

The input routine for the flasher and scrambler does not eliminate leading and trailing spaces, thus allowing a user to inadvertently produce an error without realizing why. Attempting to load a word file which hasn't been loaded (possibly by mistyping the file name) hangs the program with no explanation to the user as to what is going on. Hint! Press control-C to get back to main menu.

Word Scrambler and Super Speller are manufactured by Avant-Garde Creations, Box 30160, Eugene, OR 97403. Price is $19.95. ■

Gary Leonard
Ashby, MA

Rapid Reader

Woody Allen once told a classic joke about speed reading: "I took a speed reading course. I read *War and Peace* in just two hours. It's about Russia."

Of course the point of the joke is that anyone can read quickly, but reading quickly with comprehension is not easy.

If the aesthetics of writing are a secondary consideration and if your studies or work require the absorption of large amounts of information, then speed reading is important. Rapid Reader can help you develop a fast reading speed in a logical, step-by-step manner in a relatively short period of time.

Rapid Reader trains your eyes first to take in whole words at a rapid pace, then pairs of words, then phrases, short sentences and finally long sentences. The trick to fast reading is to learn to take in more than just one word at a time as you read. Rapid Reader allows you to approach these skills gradually. You learn to read word by word and then in clusters of words.

A good first step with the Rapid Reader program is to find out your reading speed. The Speed Test option found on the main program menu will allow you to select a speed from 50 to 1500 words per minute and a difficulty level from 1 to 4. Once you've made that selection, the program will flash a series of sentences on the video screen. After each sentence appears on the screen, it will reappear with a word missing, which you must supply. The computer will monitor your answers and evaluate your performance.

This is not a real comprehension quiz; there are limits to what a personal computer can do. It cannot judge an essay you write describing the content of the test sentences, but it can determine if you have retained what you've read. At the highest level of difficulty, you are shown two complex sentences. You then fill in a blank for one word of each sentence.

The next step is to build up your speed. If you test out at 400 wpm at the start, key in the Words option from the main menu and practice reading single words at 500 wpm or faster. Once you are comfortable at a new speed, you move to the Word Pairs, Phrases, Short Sentences and Long Sentence routines. By the time you are comfortable with Long Sentences you should be reading, with comprehension, at the speed you selected.

To test yourself, select again the Speed Test option from the main menu, and going from levels 1 to 4 of difficulty at your new word speed, see if you really are reading as fast as you'd like. If you need more work, you can always go back to the tutorial options.

One of the many nice things about this software is the option to change the words used to make sentences. You can use this feature to add words from a foreign language—turning the program into a language tutorial as well as a reading program! A Spanish word list is included on the disk.

This is one of the most accessible educational software packages available. The documentation amounts to one page, but even that much is unnecessary. The system is so logical and the program is so self-explanatory that its operation can be mastered in just a few minutes.

As for Rapid Reader's adaptability to the classroom, there remains some doubt. This is not a self-checking, record-keeping or grading program. Without some outside means of evaluating progress, the program can only be used as an aid for more motivated students. For students and professionals who really want to improve their reading speed, the Rapid Reader is a most valuable aid.

Silicon Valley Systems, 1625 El Camino Real, Belmont, CA 94002 is the manufacturer of Rapid Reader, which runs on an Apple II or II Plus system with 48K of memory and a 3.3 DOS. The list price is $39.95. ■

Dic-tio-nary

As spelling checking programs go, Dic-tio-nary does a fine job. It's reasonably priced, works at a respectable pace, has excellent documentation and its on-screen help is thorough. With a little computer savvy, you may not even have to look at the documentation.

However, since the English language is so complex, no microcomputer program can do anything more than supplement proofreading done with eye and brain. The big stumbling block is context. Many words can be spelled correctly but used incorrectly, and the various spelling checkers will whir merrily by them.

Anyone thinking of buying such a program should understand these limitations. If you type "is" and you meant "if," the error won't be detected because both words are correct. And

many words won't be in a dictionary. This program contains 25,000 words —only about five percent of the words in the English language. But, most of us rarely use the other 95 percent and Dic-tio-nary does give you the option of adding unusual words particular to your needs.

With those thoughts in mind, let's take a closer look at Dic-tio-nary. As mentioned, it contains 25,000 words and you can add another 2500. It will take a text file and read through it, stopping at every word that is either misspelled or not in its word list. You can run it in an interactive or passive mode on your printer. Dic-tio-nary can replace words automatically, and you can quickly refer to the word list if you're unsure of the correct spelling. It works with files created by Apple Pie, Apple Writer, Screen-Writer, Superscribe and other word processing systems that use standard 3.3 DOS files and require 48K Apple II or II plus with DOS 3.3 and one or more disk drives.

Here's how it works in a system with two drives: When you have finished writing, boot the Dic-tio-nary program in Drive 1. It takes about 45 seconds to load. The screen offers seven options. The first and most commonly used option is processing the document.

Here you encounter one of several thoughtful features. Whenever given a choice, you can select the default (most common choice) value merely by hitting return. As you become familiar with the program, this hastens the process. In this case you hit return and are asked to insert the program disk again, and it reads the proper portion of the program in a few seconds. It then asks for the Wordbook disk, which contains the list of words. Once this is done, it asks for the file name. (Your file should be in Drive 2.) You are given the option of turning on the printer. If you do, it goes into the passive mode using your printer to indicate words it would challenge. If you leave the printer off, it directly processes the document in the interactive mode.

In the interactive mode the program moves until it finds a suspect word. Suddenly, the screen fills. At the bottom left is the word in question. At the top is the sentence in which the suspect word appears, so you can check the context. (Some other spelling programs don't provide you with the context, while some require you to ask for it.) In the center of the screen, your options are shown. The first is to ignore the word. This is the one most frequently chosen, and it can be obtained simply by hitting return.

In the interactive mode, I found myself poised with my finger on the return key. Most of the words Dic-tio-nary finds are spelled correctly, but are not part of its word list. In general, it defines a word as any string of alphabetic characters preceded by a space and followed by another space. That means it generally stops on "words" such as the middle initial of a name. It will also stop on most proper names.

When it does find a typing or spelling error, you simply type the word correctly, and the misspelling is replaced. Any time the program comes across a repeated mistake in the document, it will automatically replace it without checking with you again. This is handy if you happen to be writing to Mr. Tchirbochnick but have referred to him as Mr. Tshirbochnick throughout your letter.

If you know the word is misspelled, but you are not sure how to spell it correctly, you have another choice. You move the cursor over as much of the word you believe is correct. This could be the first letter, first three letters, or whatever. You place an asterisk at this point, then hit return. The relevant portion of the Wordbook comes up on screen, and you can quickly find the correct spelling and then make the change.

CE SOFTWARE presents:

PROGRAMMERS POWER TOOLS™

If you do lots of programming on your Apples® you're wasting a lot of time if you're not using Programmer's Power Tools.

Now, you can take advantage of machine-language speed in your Applesoft® programs. Expand your BASIC® commands like:
■ **Sort** a string array. ■ **Search** a string array.
■ **Cut** garbage collection time by 90%. ■ **Format** numeric output. ■ **Pack** numbers. ■ **Read** anything from a disk.
■ **Utilize** a machine language input routine that will help you "rival the masters".
See our "report card" in InfoWorld: May 16.

Progammers Power Tools][, for the Apple //e and][+, or Programmer's Power Tools /// for the Apple ///. It's the kind of fast powerful programming aid you've been looking for.

PPT][(for //e also) $59.95
PPT /// $79.95

Available at your local computer store or order direct from:

CE SOFTWARE
801-73rd Street • Des Moines, Iowa 50312
(515) 224-1995

Visa/MasterCard Accepted

Both PPT][and PPT /// are sold on unprotected diskettes and can be included in your own programs. (Programs using PPT that are to be sold nationwide may require registration and payment of a token licensing fee.)

If the word the program finds isn't in the Wordbook and you don't know if it's spelled correctly, it's back to the old-fashioned method of checking. If it's a word you may be using again soon, add it to the Wordbook.

Yet another option allows a word to be flagged for later replacement. I frequently miss the space bar when typing and thus run two words together. These can't be corrected in the interactive mode by simply putting a space between them. If this is done, then the double word is replaced by the first word. The second word is lost. The cure? Flag it. The program allows you to pick a flagging symbol that's infrequently used. I chose the percent sign. When you return to your word processor editor, search for the flag and make the corrections.

A file can also be reviewed in the passive mode. Turn the printer on at the start and the program will print out all words it challenges. You can then take this list and go back to your word processor, using the search feature to find and replace the incorrect words.

You have to live with Dic-tio-nary for a while to get used to its quirks. After it had finished reading this review, for example, some errors were still present:

- "It's" was used where the possessive, "Its" was intended. (The program does know many contractions.)
- The singular "word" was used where the plural "words" was needed, a matter of context.
- "English" appeared with a lower case "e" rather than the proper upper case. (The program is consistent about case when you change a word, a mixed blessing.)
- A lone "ar" was left in where an "are" was intended. This one really had me fooled. A check of the Wordbook disk showed it regarded "ar" as a word. A check of the dictionary showed "ar" was a seldom used form of "are" meaning the metric name for 100 square meters. It certainly didn't make sense to include such a rare word, and it took some more study of the Wordbook disk before I discovered such words as "nd," "sc," "va" and "conn" were all present. Then it dawned on me. These were abbreviations for the states. Helpful, perhaps, but sometimes programs can be too helpful.
- As reported with other programs of this sort, there are some mistakes in spelling in the Wordbook.

As is common with such programs, Dic-tio-nary does word frequency analysis. It can do this on screen—letting you know how many different words were used and how often individual words were used.

Given the various shortcomings of this type of program, is Dic-tio-nary worth the investment? For me, yes. My copy came as part of a package deal called "Screenwriter II Professional." As long as it continues to find errors, it will be a valued tool.

The Dic-tio-nary is manufactured by Sierra-On-Line Systems, 36575 Mudge Ranch Road, Coarsegold, CA 93614. Price is $99.95. ■

Cosmic Combat

In Cosmic Combat you and your trigger finger are pitted against a variety of space creatures. The monsters are defended by from one to three hovering, weaving malignite mines. Hit one and you lose one of your five initial fighter ships.

You may begin play at any of the first three levels. Starting at the higher levels makes getting a high score very difficult (since points are easier to obtain in the lower levels), but this approach does let you skip past those levels that you have mastered. You are awarded an extra ship for scores of 50,000 and 100,000. The game

Circle 242 on Reader Service card.

ends when your ships have been eliminated.

Each level consists of two parts. In the first part, creatures descend from above and scroll straight down toward the bottom of the screen. If the creatures are lower on the screen than the malignite mine(s) when shot, you receive one point. If they are higher than the mine(s), you are awarded between 15 and 55 points. Each scrolling creature must be struck five times in order to kill it. If one of them touches you, you are usually destroyed.

In the second phase of each level, the five fiends of Fantus (the galaxy in which the game is located) whip back and forth across the screen and drop atomic phasor balls at your ship. Two hits on each fiend is required for destruction.

In levels 2 and beyond, space serpents appear on one or both sides of the screen. Shots from your fighter repel the serpents but do not destroy them. If one lands on your ship, it is eaten! In level 3 a winged whizzer joins in the attack. It too cannot be destroyed, but can be repelled momentarily.

Evaluation

Evaluating Cosmic Combat is a study in confusion. It has the makings of a good game, but in its present state, it suffers from poor design and engineering, boring graphics, and an abysmal instruction booklet.

The cover design of the instruction booklet is easily its most outstanding feature. The contents, however, are a letdown. Incorrect statements abound. The instructions begin by describing the creatures to be encountered at level 1. Unfortunately, several of the creatures described do not appear at that level.

The instructions are replete with misspellings and monsters which mysteriously change names. Next time, I strongly suggest that Highlands hire a competent proofreader and someone adept at writing documentation.

With the exception of the serpents at levels 2 and above, all graphics are hollow line drawings. The serpents, on the other hand, are exceptionally well done. If the other figures were done in a similar fashion, it would add immensely to the game's appeal.

Some of the creatures suffer from a case of the flickers. This seems to happen most often when a pair of the scrolling monsters overlap one another.

The selection of the P key to place the game in Pause mode is a definite mistake. The action in this game is very fast. Searching for and hitting P while you are working a joystick or paddle is quite a task. If possible, use of escape would make things simpler (given its edge placement) and conform to virtually every other game on the market.

There is no perceptible pause between levels of play. After killing the last scrolling creature, you are immediately bombarded by the fiends' atomic phasor balls. If one of these hits you and you fail to reposition your joystick quickly, it is not unusual to find your ship destroyed again as it reappears on the screen. A simple pause loop or a chance to move your ship before each attack would be appreciated.

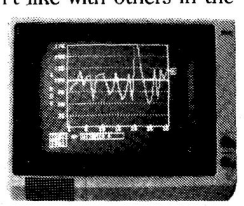

It is unclear what is supposed to happen when one of the scrolling creatures strikes your ship. In some instances, you are destroyed. In others, they pass harmlessly through you. I'm not certain whether this is as it should be or whether the program simply suffers from a poor collision detector.

On the plus side, Cosmic Combat does seem to have potential. By holding down the paddle/joystick button, you can fire like a machine gun. I also

liked the ability to start at different levels of play. Both are nice touches. On the whole, however, the game leaves one with the impression that it wasn't quite finished.

Cosmic Combat is distributed by Highlands Computer Service, 14422 S.E. 132nd, Renton, WA 98056. Price is $29.95. ■

Steven Schwartz
Pittsburgh, PA

Dragon's Keep

Dragon's Keep is a nonviolent search game whose object is to free 16 animals held captive by a dragon. The program helps develop and/or reinforce map skills, vocabulary and logical thinking.

You select high-resolution pictures of different neighborhood locations, and if the dragon appears in the picture, you cannot free any animals at that location. You must return later and hope the dragon doesn't randomly appear again.

The program offers easy space bar selection for making location selections including an option at the beginning to try out the space bar method.

With a video monitor it offers nice graphics pages with many cute animals. It allows the sound to be turned off or on, and the text is an appropriate second grade reading level.

Dragon's Keep is manufactured by Sunnyside Software, 5815 East Parkside, Fresno, CA 93727. ■

Cider Vinegar

Harness Race Handicapper, July

There is a small error in the "Harness Race Handicapper" listing on page 82 of the July *inCider*. Unfortunately, this causes most of the screen output to appear in inverse. Please advise readers that line 90 should read:

```
90 VTAB 4:PRINT "(C) STEVEN R.
SCHWARTZ, PH.D., 1982": NORMAL:
PRINT:PRINT:PRINT
```

The last four statements (after 1982":) were omitted.

Steven A. Schwartz
9226 Vantine St.
Pittsburgh, PA 15235

Applesoft Adviser, June and July

On page 37 of my June column, I inadvertently switched a "less than" sign for a "greater than" sign, and then got carried away with myself. My thanks to Ken Kashmarek of Eldridge, IA for calling this to my attention. In the first paragraph on page 37, the three Basic lines should read:

```
1530 R = PEEK( - 16384)
1540 POKE - 16368,0
1550 IF R > 127 THEN R$ = CHR$(R - 128)
```

The four lines of text that follow this listing, to the end of the paragraph, should be obliterated.

A similar correction is needed at the end of the next paragraph, changing lines 1540 and 1550 to read:

```
1540 R = PEEK( - 16384): POKE - 16368,0
1550 IF R > 127 THEN T = 3000: R$ = CHR$
(R - 128)
```

Finally, on page 32, a similar change is required in Listing 3. Change line 150 to read as shown below, and add line 155.

```
150 R = PEEK( - 16384): POKE - 16368,0
155 IF R > 127 THEN R$ = CHR$(R - 128)
```

Two typos sneaked into my July column on page 30. Line 80 and line 85, both appearing in program segments within the text, should have the letter I instead of the number 1. Thus lines 80 and 85 should read:

```
80 PLOT I, 4 + I
85 PLOT I, 44 - I
```

APPLE CASES

A series of studies in the application of Apples to business and other serious stuff.

– CASE 1 –

The importance of a good business card.

THE SITUATION: You have an ordinary Apple II or Apple IIe. You don't have megabucks to spend. You need extraordinary performance from word processing, spreadsheets, data bases, communications and your other applications programs.
QUESTION: How will a new business card help?
ANSWER: Choose your business card from the VISION-80 family of products.

VISION-80 80 Column Text Card

A sophisticated, easy to use 80 column card rated No.1 by reviewers around the world.

80 Column Display:
Largest available 9 * 10 dot matrix, giving a superb set of 128 upper & lower case characters, & a crisp set of line/block graphics, with software switching between 40 and 80 column screens.

Compatibility:
Fully compatible with Applesoft BASIC, PASCAL, MICROSOFT CP/M, FORTRAN and ASSEMBLER.
Fully compatible with most quality word processing, speadsheet, data base and applications programs.

Communications:
Full smart terminal emulation, file transfer & save, and screen print facilities.

Installation:
Installed in seconds into the standard Apple II or IIe, with no hardware or cabling changes for normal Apple operation.
All this and a set of powerful utility programs.

NOW ONLY $195.00

VISION-128 128K Memory Expansion Card

A powerful RAM card which increases the available memory space of your Apple II or IIe from 64K to an incredible 192K.

Compatibility:
Fully compatible with all Apple software, and 'transparent' to the user.

VisiCalc Enhancement:
Provides all the extra bytes for storing large VisiCalc models in RAM.

Automatic Operation:
Utility programs can automatically activate the card when more RAM memory is required.

NOW ONLY $295.00

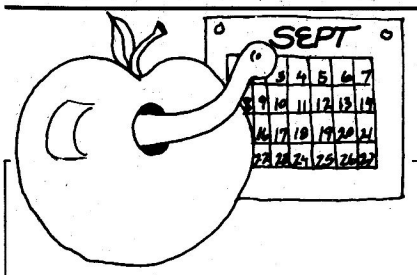

VISION-VCE
VisiCalc Expander
PREBOOT DISK
Automatic VisiCalc preboot procedures for both the Apple II & Apple IIe, utilizing VISION-80 VISION-128K

New Software

Antonym Game

J & S Software, 140 Reid Ave., Port Washington, NY 11050, offers the Antonym Game, a high-resolution baseball game containing more than 600 antonym combinations.

The game is designed to improve scores on the SAT examination, and it contains a utility that allows teachers to list and change any and all words. Price is $29.50. Reader Service number 440.

Medical Billing

CMA Micro Computer, 55722 Santa Fe Trail, Yucca Valley, CA 92284, offers a new Client Medical Billing System for the Apple IIe.

The user can develop separate databases containing patient data for the daily input and reporting of billing activity, for the preparation of private patient statements and for the preparation of American Medical Association claim forms.

The package requires and Apple IIe with an 80-column card, two disk drives and a 130 column printer. Price is $1595. Reader Service number 441.

Critical Mass

Sirius Software Inc., 10364 Rockingham Drive, Sacramento, CA 95827, offers Critical Mass, an adventure game featuring color graphics, music and arcade-style sequences.

The player must find and stop a madman intent on blowing up the world. A clock adds a problem-solving dimension to the game: the player must deal with plane schedules and international time zones in his/her race to save the world. Price is $39.95. Reader Service number 443.

Telofacts 2

Telofacts 2, a software program that designs and analyzes questionnaires, is offered by dilithium Software, 11000 SW 11th St., Suite E, Beaverton, OR 97005.

It provides the user with the ability to gather opinions, resumé information, marketing data, survey data, or any other question/answer information. It then analyzes and displays responses in a variety of ways. Telofacts 2 displays results in report format and it ranks, lists, or scores respondents. Price is $199.95. Reader Service number 444.

Spare Change

Spare Change is a new game for the Apple II that depicts a comically quarrelsome relationship between the owner of an arcade (you) and your impatient partners, the Zerks. Price is $34.95. Contact Broderbund Software, 1938 4th St., San Rafael, CA 94901. Reader Service number 447.

Best Crop

A software package to help farmers manage the details of producing crops is offered by Agricultural Software Systems Inc., Suite 109, 1216 Dawson Road, Albany, GA 31707.

The Best Crop program consists of six interlocking modules. It allows the farmer to set up information for different farms and to then enter all necessary crop data. Features of Best Crop include the ability to record and analyze soil fertility and to measure how well a particular farm or field performs. Price is $895. Reader Service number 445.

Statistics and Probability

A new series of software that develops skill in the study of statistics and probability is offered by COMPress, Box 102, Wentworth, NH 03282.

The series illustrates concepts of statistics and probability with color graphics, tutorial problems and simple simulations. The series currently includes Chi-Square Analysis of Contingency Tables and Discrete Probability, Part I and II. Each program is $75. Reader Service number 448.

TermExec

Exec Software Inc., 201 Waltham St., Lexington, MA 02173, offers TermExec, a communications package for the Apple II.

TermExec turns your Apple into an intelligent workstation. It provides a backscrolling capability with a 10,000 character scrolling buffer, which allows you to review lines that have gone off the screen. Lateral scrolling allows you to unwrap lines up to 80 characters and to scroll left and right. You can talk to any host, and the program can send and receive long files unattended. Price is $49.95. Reader Service number 449.

Dr. Grafix

Dr. Grafix is a graphics utility package for beginning and intermediate programmers. Shapes can be designed on the hi-res screen. Shape tables can be custom built, edited and reorganized. Tutorial demonstrations include details for animating your programs.

Contact Micro Program Designs, 5440 Crestline Road, Wilmington, DE 19808. Price is $19.50. Reader Service number 450.

Microscreens

PMI Inc., Box 87, Buckfield, ME 04220, offers Microscreens, a screen generator package that allows the user to produce monitor screen formats.

Using a few lines of code in Basic, selection menus, data entry and inquiry display can be developed—reducing programming time as much as 40 percent. Price is $119. Reader Service number 451.

4-Track Editor

Passport Designs Inc., 116 North Cabrillo Highway, Half Moon Bay, CA 94019, offers 4-Track Editor, a program that allows the user to write music with or without extensive keyboard knowledge.

The user can compose directly with the Apple or work from a written score. The composition can then be edited into a standard Soundchaser TRAKS file and played back.

The program requires a Soundchaser computer

music system, an Apple II, II Plus, or IIe, a disk driver with controller and audio and video monitors. Price is $195. Reader Service number 452.

Decision Analyst

Decision Analyst helps professional managers and businesspeople analyze complex business problems where many alternatives are present.

It takes the user through eight sections including problem definition, statement of decision purpose, calculation of criterion values, assessing possible adverse consequences and final conclusions and choice. Price is $139. Contact Executive Software Inc., Two North State St., Dover, DE 19901. Reader Service number 453.

MemoryTrainer

MemoryTrainer enables users to improve their ability to remember faces, dates, telephone numbers, lists and quotations. It is designed for those who have career oriented memory demands.

It is a fully-structured tutorial system with color graphics that includes the following instructional materials: Names and Faces, Method of Loci, Peg Word System, Important Dates, Phone Numbers and Memory Mix Game. Price is $89.95. Contact the Einstein Corp., 11340 W. Olympic Blvd., Los Angeles, CA 90064. Reader Service number 454.

dataKeyper

ESP Computer Resources, 9 Ash St., Hollis NH 03049, offers an enhanced version of dataKeyper, a database manager for the Apple II Plus.

It can be used for on-line or batch processing and includes automatic restart capability. Price is $99.95. Reader Service number 455.

Grade Manager

Classroom Grade Manager helps teachers store, compute and retrieve student grades. An entry system allows rapid recording of student data, and a name search routine provides access to individual records.

Classroom Grade Manager can handle 18 grades per quarter for up to 50 students per class. There are reports for listing and averaging both current and semester grades, for class ranking and for analyzing exam statistics over a period of years. Price is $149.95. Contact Hayden Software Company, 600 Suffolk St., Lowell, MA 01853. Reader Service number 456.

Programming Power

Programmer's Power Tools II allows programmers to perform sorts and searches, format numbers on the screen or printer and build user-friendly input routines.

The program also includes a manual with quick reference sections, commented listings of demonstration programs and customization notes. Price is $59.95. Contact CE Software, 801-73rd St., Des Moines, IA 50312. Reader Service number 442.

edited by Tom Woods

Financial Management

Managerial Finance in Action is a computer assisted instruction course in financial management.

The course is divided into five sections. Subjects include: the language of finance and accounting; interpreting financial reports and statements; improving business decisions; communicating with financial specialists; measuring profit, financial condition and business performance; and using your Apple as a financial tool.

The program package includes 120 pages of documentation, 10 floppy disks, and five audio tape cassettes. Price is $375. Contact International Management Institute Inc., 34 Maple St., Summit, NJ 07901. Reader Service number 464.

Kleen Line

Electronic Specialists Inc., 171 South Main St., Natick, MA 01760, offers the Kleen Line security system, a system designed to protect modems by supressing damaging telephone line spikes. Price is $56.95. Reader Service number 475.

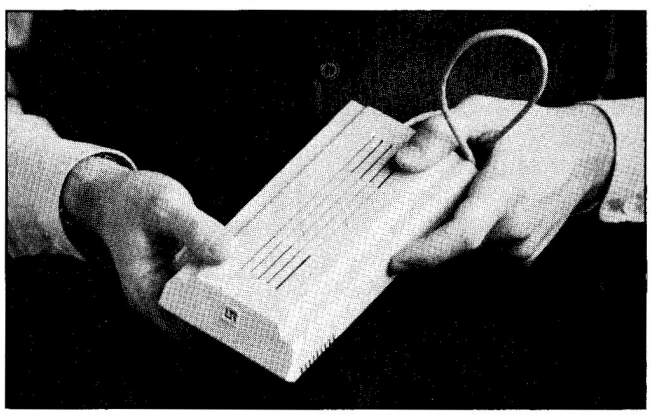

Ed. Software Directory

Sterling Swift Publishing Company, 7901 South IH-35, Austin, TX 78744, offers Swift's Educational Software Directory Apple II Edition for 1983–1984.

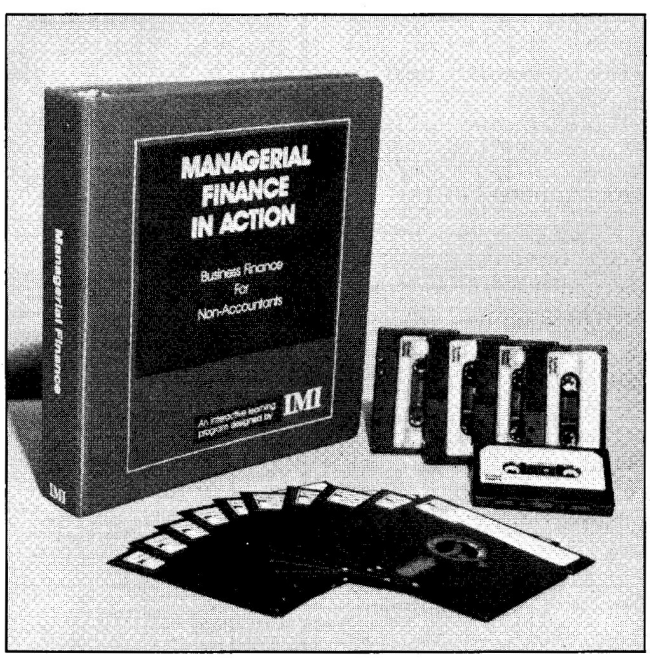

The directory is organized by subject, with a Publisher Information section and Master Index. Price is $18.95. Reader Service number 461.

The WattsOut anti-static device.

The Password modem from US Robotics Inc.

Managerial Finance in Action.

WattsOut

WattsOut Inc., 2020 S. Oneida St., #201, Denver, CO 80224, offers an anti-static device for microcomputers. When users place the device on their equipment, attach it to a ground and touch it before using the keyboard, static electricity is drawn harmlessly away. Price is $9.95. Reader Service number 473.

Special Ware

The SpecialWare Directory is a directory of courseware and software products for special education materials.

Compiled from an independent survey, the Directory lists the products of more than 100 companies. Curriculum skill areas, educational levels, hardware compatibility and warranty and preview policies are indicated for each listing. Price is $10. Contact LINC Associates Inc., 1875 Morse Rd., Suite 215, Columbus, OH 43229. Reader Service number 474.

Password

US Robotics Inc., 1123 West Washington Blvd., Chicago, IL 60607, offers a new 300/1200 baud, dial/auto answer modem, the Password.

The Password has programmable auto dial and auto answer capabilities, auto mode and auto speed select functions, and an audio phone line monitor. At 1200 baud the Password can process as many as four typewritten pages per minute. Price is $449. Reader Service number 462.

APPLE® MODEM. WITH EVERYTHING.

$129

Your best buy in modem history. The **Networker**™ a plug-in single-slot direct connect modem for your Apple II, II+, and IIe (or Franklin, Albert, or other Apple compatible computer). You are immediately linked to the vast network of computers — data bases like the Source,® Compuserve,® or Dow Jones,® friends, banks, businesses, and hundreds of local "bulletin boards." For only $129. There's absolutely nothing else to buy. And it even comes with software.

This is the modem that does it all, and does it for less. The Apple Communications Card is on board, so you won't need to buy one. That will save a bunch. It's 300 baud, the most commonly used type of modem. It comes complete with its own communications software on Apple compatible disk, giving you features ***no*** modem offers.

Like "data capture" to lock the messages into your Apples' RAM, and then move the information onto a disk for easy reference and review. A terminal program that turns your computer into a communications command center, displaying on-screen "help" menus, continuous updates of memory usage, carrier presence, baud rate, communications status, all while taking in and displaying information from any computer.

The **Networker** supports both originate and answer modes, so you can send and receive information, in full or half duplex modes. And its all easily programmable right from the keyboard of your Apple computer. All you do is plug **Networker** into any slot (except 0) in your Apple computer. It'll even ask you what slot it's in. It's that easy to use.

NETMASTER™ COMMUNICATIONS SOFTWARE

For $179 we include the even more incredible **Netmaster** software for advanced users. **Netmaster** is a "communications freeway" that lets you speed any Apple file to another Apple through noisy phone lines, without errors. **Netmaster** even includes its own Disk Operating System to control the flow of information and leave you over 40K of "buffer" memory from your 64K RAM. And there's always help when you want it. On screen. Status indicators keep you fully updated.

Netmaster will let you transfer games, computer graphics, programs, sales reports, documents, any DOS 3.3 file, all directly from disk to disk, all with computer (not telephone) accuracy. **Netmaster** is completely configurable to understand any computer, even mainframes. File size is unlimited.

But **Netmaster** is not stuffy. It will talk to the other communications packages like Visiterm® or ASCII Express.® Of course they don't support **Netmaster's** superb error checking, that guarantees you won't miss even a comma. It doesn't only talk to the Networker either. It will also talk to those more expensive modems from Hayes and Novation.

And **Netmaster** is fast. It transfers information disk to disk three to five times faster than the others. Of course **Netmaster** is fully compatible with them. But if you want things to happen really fast, talk to another Netmaster.

We sell **Netmaster** by itself for $79, and even if you have another modem for your Apple, **Netmaster** is an outstanding value. It will even support auto dial and auto answer. **Netmaster** requires 48K of Apple memory, disk drive and DOS 3.3, and ZOOM's **Networker** modem or another modem. It can also be used without a modem when two Apples are hardwired together, using a 6850 or 6551-based interface card.

Networker, **Netmaster**, and **Networker/Netmaster** combo are all produced in the USA by ZOOM Telephonics, producers of the popular **DEMON DIALER.** The Networker is FCC registered, and all products come with a one-year warranty.

HOW DO I GET ONE? OR TWO?

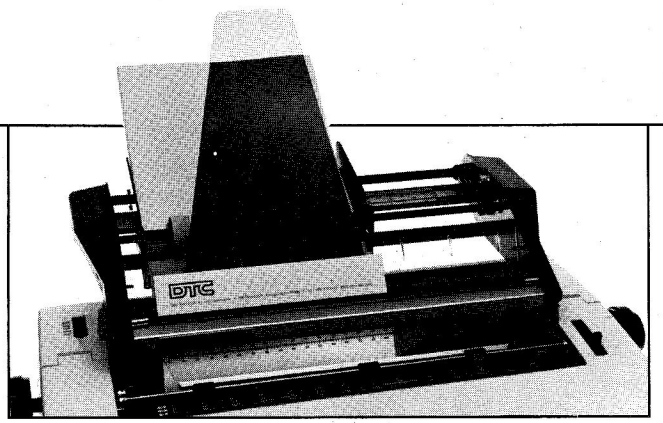

Check with your computer dealer. Or call us direct at 1-800-631-3116, and we'll let you know where to get them in your area.

Massachusetts residents call 617-423-1288.

The EZ Mate sheet feeder.

Franklin Computer Inc.'s Ace Display Card.

Sheet Feeder

Data Terminals & Communications, 590 Division St., Campbell, CA 95008, offers a new sheet feeder for daisywheel printers.

The EZ Mate requires no software or hardware modifications, and it can be installed or removed in seconds. It can reverse the paper for graphic and columnar printing and can insert envelopes or individual sheets of paper without unloading the feeder. Price is $795. Reader Service number 460.

Ace Display Card

Franklin Computer Corporation, 2138 Route 38, Cherry Hill, NJ 08002, offers the Ace Display Card, a product that expands the video display capabilities of Franklin Ace 1000 and Apple II computers.

The Card provides four cursor choices: blinking block, non-blinking block, blinking line and non-blinking line. It accommodates the full upper and lowercase 128-character ASCII set, including line drawing graphics. Price is $199. Reader Service number 466.

ARE YOU BUYING USED SOFTWARE?

If you think that "rent before you buy" software plans are a good idea, you're right. But think again.

THE VULCAN SOFTWARE NO-NONSENSE RIGHT OF RETURN GUARANTEE:

1) You get new, factory fresh software. Not software that's "rented" until it gets sold. Guaranteed.

2) You get a FULL MONTH (not just a week) to evaluate the package. If you aren't happy with it for any reason, send it back for a refund. No questions asked. Guaranteed.

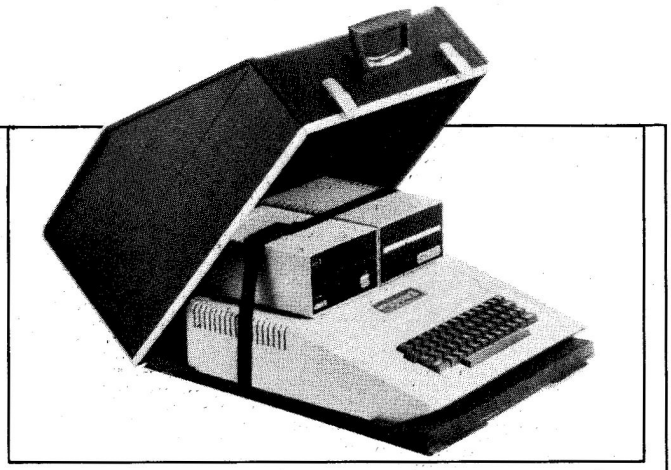

3) You get an 80% refund on Business, Educational, and Utility software; 50% refund on selected Games. If you don't buy, you pay less than "rental fees". Guaranteed.

Low, competitive prices. No membership dues. Free newsletters. Large selection of EDUCATIONAL software.

1805 SAULTER ROAD
BIRMINGHAM, AL 35209

(205) 871-5510

The Apple Computer case from Fiberbilt.

tiac, MI 48054, offers a new 18K static RAM card for the Apple II, II Plus and IIe.

The card contains a battery backup system to allow memory retention after power-down. A write-enable/write-protect switch allows the user to protect the information in the card or alter it at will. Price is $159.95. Reader Service number 471.

Bufferlink

Perisoft, 2084C Walsh Ave., Santa Clara, CA 95050, offers the Bufferlink add-on printer buffer.

Bufferlink accepts data as fast as your computer can accept it, then stores it and feeds it to a printer at the printer's own speed. It can be used with many popular parallel printer interfaces. Price is $159 for the 16K version. The Bufferlink is upgradeable to 64K. Reader Service number 467.

Computer Case

The Apple Computer Case serves two functions: it can be used as a security cover in the classroom to prevent unauthorized access to controller cards or software and it allows students, teachers and others to safely transport their Apples.

The case holds an Apple II with one or two disk drives and retails for $65. Contact Fiberbilt, 601 West 26th St., New York, NY 10001. Reader Service number 463.

Megaflex

Sorrento Valley Associates Inc., 11722 Sorrento Valley Rd., San Diego, CA 92121, offers Megaflex, a flexible-disk controller designed for the Apple II and III.

Megaflex is fully compatible with Apple SOS, DOS 3.3, Pascal and CP/M. It allows users to have up to four drives installed per controller. Price is $349. Reader Service number 468.

Flashcard

A new plug-in state board for Apple computers that emulates the Apple floppy disk drive but executes programs up to 10 times faster than normal is available from Synetix Systems Inc., 15050 NE 95th St., Redmond, WA 98052.

Flashcard, available in 147K and 294K versions, is compatible with most DOS, CP/M and Pascal programs that are not copy protected. A user can copy a program disk on the Flashcard.

The 147K Flashcard is priced at $395, and the 294K version costs $695. Reader Service number 472.

Circuit Judge

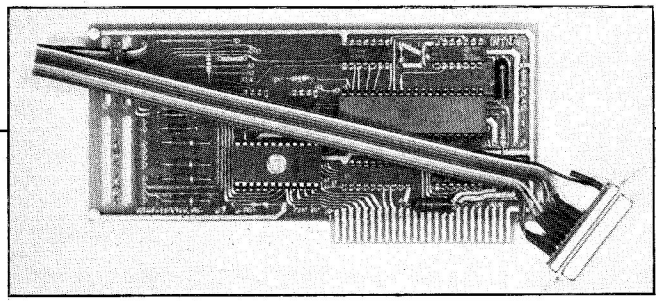

Digitronics, 53 John St., Cumberland, RI 02864, offers the Circuit Judge, an A.C. line monitoring system for use with voltage sensitive computers.

The Circuit Judge plugs into a standard 110 volt A.C. outlet and monitors the A.C. circuit for surges of 300 volts or more, high voltage in excess of 125 volts, low voltage of 100 volts or less and power loss. Price is $129.95. Reader Service number 470.

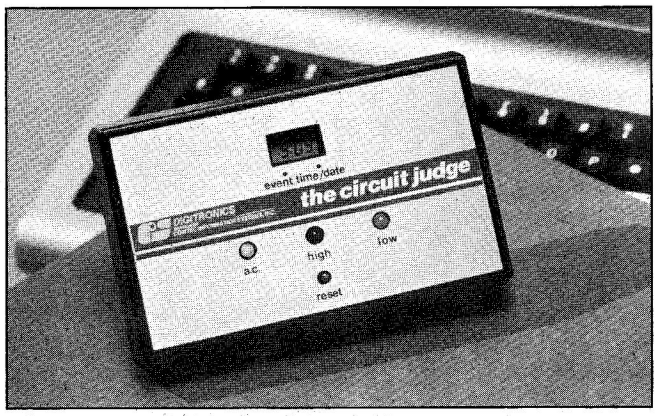

Fast Point

HEI Inc., Victoria, MN 55386, offers the Fast Point, a new light pen and controller designed for the Apple II Plus.

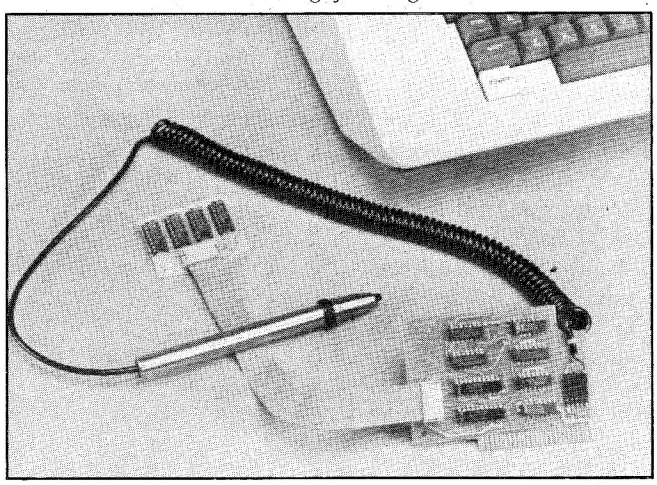

The pen can be used for cursor control and menu picking applications, as well as low-resolution graphics tasks. The pen has a touch-sensitive switch that generates a signal when the tip is placed against an unblanked spot on the CRT. The Fast Point comes with software instructions and a demonstration disk. Cost for pen and controller is $240. Reader Service number 469.

When these aliens get personal—

their brats get deadly

You've never had more charming, lovable aliens residing on your screen. Different shapes, different colors—and thoroughly friendly . . . until they meet in the MATING ZONE. Once they do, they produce offspring who are genetically mean and ornery. And their mission in life is to take yours!

At each level you find different aliens who have this great compulsion to produce mutated offspring—and it becomes easier for them, but more difficult for you, as the number of Mating Zones increase at each level!

MATING ZONE

For the most intriguing, enjoyable game of the year—visit the MATING ZONE and try to stop the population explosion!

TRUNKS FOR THE MEMORIES.

Introducing the most logical place to store Elephant Memory Systems® (or lesser brands of disks): The Trunk.

With its alphabetized library index, you can file or retrieve up to 60 disks, instantly.

The Trunk is made of durable molded plastic with a hinged, one-piece lid, to keep disks safe from dust, dirt, and other detriments which disks despise.

And, it's portable. Because the lid doubles as a carrying handle so your Elephant Memory Systems® disks can go anywhere you do.

There's a model for 5¼" and 8" floppies, as well as a cassette-and-game file and a special Atari® version.

So if you're looking for the best disk storage system on the market . . .

The Trunk is an open-and-shut case.

THE TRUNK. ENDORSED BY ELEPHANTS.

Elephant Memory Systems® Disks

A full line of top-quality floppies, in virtually every 5¼" and 8" model, for compatibility with virtually every computer on the market. Guaranteed to meet or exceed every industry standard, certified 100% error-free and problem-free, and to maintain its quality for at least 12 million passes (or over a life-time of heavy-duty use).

Marketed exclusively by Leading Edge Products, Information Systems and Supplies Division, 55 Providence Highway, Norwood, MA 02062. Dealers: Call toll-free 1-800-343-8413; or in Massachusetts, call collect (617) 769-8150
